Mobile Security Products for Android Philipp Kratzer, Christoph Gruber, Andreas Clementi, David Lahee, Philippe Rödlach, Peter Stelzhammer, 2014-10-14

We have once again tested security products for smartphones running Google's Android operating system. Our report covers details of the products made by leading manufacturers. Smartphones represent the future of modern communications. In 2013, more than 1 billion smartphones were sold, a further milestone in the advance of these devices.¹ A study published by Facebook emphasises the importance of smartphones in our lives: about 80% of users make use of their smartphone within 15 minutes of waking up each day. At the same time, the traditional function of a telephone is becoming less and less important. The high quality of integrated cameras means that the smartphone is increasingly used for photography. As well as with photos, users trust their devices with their most personal communications, such as Facebook, WhatsApp, and email. This brings some risks with it, as such usage makes the smartphone interesting for criminals who attempt to infect the device with malware or steal personal data. There is also the danger brought by phishing attacks. These days, the use of security software on a PC or laptop is seen as essential. However, many smartphone users do not yet have the same sense of responsibility, even though their devices store personal data, private photos, Internet banking information, or even company data. As modern smartphones are often expensive to buy, they are also an attractive target for thieves. Top-quality smartphones cost several hundred Euros. As it is not possible to physically prevent them from being stolen, they must be made less attractive to thieves. Consequently, many of today's security products contain not only malware protection but also highly developed theft protection functions, which make the device less attractive to thieves, e.g. by locking the device and helping the owner to find it again.

Studies in Conversational UX Design Robert J. Moore, Margaret H. Szymanski, Raphael Arar, Guang-Jie Ren, 2018-09-03 As voice interfaces and virtual assistants have moved out of the industry research labs and into the pockets, desktops, and living rooms of the general public, a demand for a new kind of user experience (UX) design is emerging. Although the people are becoming familiar with Siri, Alexa, Cortana, and others, their user experience is still characterized by short command or query oriented exchanges rather than longer conversational ones. Limitations of the microphone and natural language processing technologies are only part of the problem. Current conventions of UX design apply mostly to visual user interfaces such as web or mobile; they are less useful for deciding how to organize utterances by the user and the virtual agent into sequences that work like those of natural human conversation. This edited book explores the intersection of UX design of both text or voice based virtual agents and the analysis of naturally occurring human conversation, e.g., the Conversation Analysis, Discourse Analysis, and Interactional Sociolinguistics literatures. It contains contributions from researchers from academia and industry with varied backgrounds working in the area of human computer interaction. Each chapter explores some aspect of conversational UX design. Some describe the design challenges faced in creating a particular virtual agent. Others discuss how the findings from the literatures of the social sciences can inform a new kind of UX design that starts with conversation.
