

RNS 510 Radio/Navigation System

How the touch screen works

The touch screen used on the RNS 510 radio/navigation system works according to the resistive principle. This means that the touch recognition uses resistance-based technology.

When you touch the touch screen, the outer glass layer is pressed against the glass base layer. The two indium tin oxide coatings, which are separated by the spacer dots when the screen is not touched, come into electrical contact.

To simplify explanation, you can imagine the touch-sensitive surface that is formed by the two indium tin oxide-coated glass layers as a coordinate system. Each touch point on this surface can be located with a horizontal and vertical distance from the edge of the monitor. Electrical resistances are used as values for the horizontal and vertical distances.

A horizontal and vertical coordinate value is determined by current flow direction of the two coatings being turned 90° towards each other. A direct voltage of 5 volts is applied 25 times per second alternating to the upper or lower indium tin oxide layer.

The touch screen signals are evaluated via a separate controller in the radio/navigation system.
