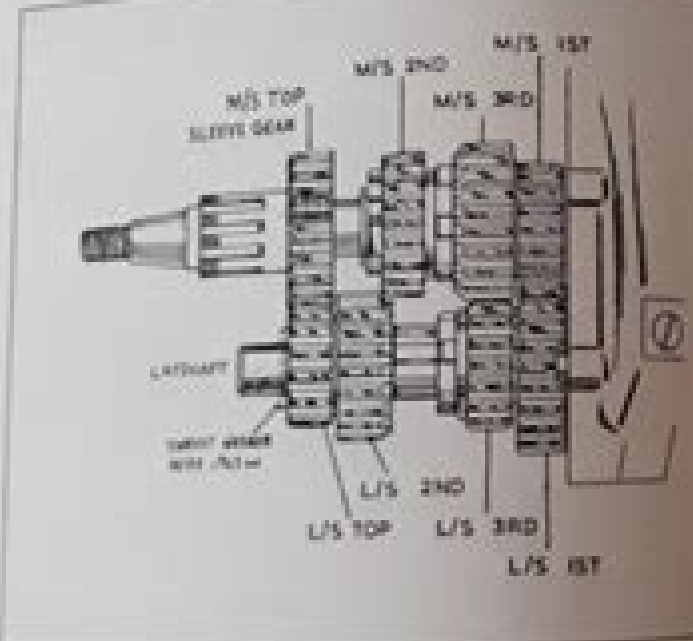

Illustration 9.15 - Gear cluster view from the rear

To adjust spring position:

1. Fit the collector fork, push into hole in the camshaft.
2. Fit a collector fork into it.
3. Fit the spring assembly. Push the fork lightly into the spring.

The aim is to adjust the position of the spring so that it is in contact with the collector fork, such that there is a constant clearance between the edge of the spring and the collector fork and vertically, so that the push of the spring is to line with the collector fork while the spring is depressed as it will be when the cam plate pushes against it. Measure the spring with a finger to push, not the fork. When operated with the spring position, push the spring and check up the adjustment.

Fitting the (new) gear change spring (Illustration 9.16 and 9.17)

When fitted to the gear change shaft, a new spring should sit straight and be free, and should connect to the plate without any hindrance. It should be in the correct position.

You have to actually fit and measure the spring. There is a lot of a lot to it. The part of the spring that is left - hard to describe, but it helps to get a wire through the hole in the hole to check the position.

There should also be no gap in the adjustment for the spring and the cam in the spring. If you are not happy with the fit of your new spring, take it back to the vendor and compare it with the quality of pattern parts there.
