J. Pieterse, Marcel Dicke, Saskia C. M. Van Wees, Erik H. Poelman, 2014-04-14 Plants are members of complex communities and interact both with antagonists and beneficial organisms An important question in plant defense signaling research is how plants integrate signals induced by pathogens insect herbivores and beneficial microbes into the most appropriate adaptive response Molecular and genomic tools are now being used to uncover the complexity of the induced defense signaling networks that have evolved during the arms races between plants and the other organisms with which they intimately interact To understand the functioning of the complex defense signaling network in nature molecular biologists and ecologists have joined forces to place molecular mechanisms of induced plant defenses in an ecological perspective In this Research Topic we aim to provide an on line open access snapshot of the current state of the art of the field of induced plant responses to microbes and insects with a special focus on the translation of molecular mechanisms to ecology and vice versa **Plant Responses to the Dark Scenario** Péter Poór, Attila Ördög, M. environments such as salt excess in soils as well as investigating novel approaches to boost stressed plant physiological performance are vital components that need to be addressed if we are to achieve food security. Multiple genes involved in the ABA signaling pathways are known to respond and start plant adaptive responses when facing salt stress. In addition, several transcription factors such as the phytochromes and zinc finger proteins play roles in regulating the morphological responses of plants under stress. Antioxidant enzymes are also upregulated in response to higher content of salt. Recently, nanobiotechnological approaches aimed at delivering cargoes such as micronutrients or chemicals in a cell specific manner are a promising alternative to aid plants in combating stress. Similarly, using nanofertilizers shows favorable effects in plants under hostile environments. CRISPR/CAS is an emerging powerful and feasible tool to modify genes and be applied to plants to make them more tolerant to salt in excess.

Understanding the Molecular Mechanisms of Plant Responses to Abiotic Stress Sang Yeol Lee, Dae-Jin Yun, Jose M. Pardo, Motoaki Seki, Yan Guo, Abel Rosado, 2020-02-20

Plant responses to environmental stress are governed by complex molecular and biochemical signal transduction processes which act in coordination to determine tolerance or sensitivity at the whole plant level. Upon exposure to abiotic stress, plants express a sophisticated coordinated response to reprogram interconnected defense networks and metabolic pathways by alterations in the transcription, translation, and post-translational modification of defense-related genes and proteins. Traditionally, physiological and phenotypic responses were the major ones to be collected in plant stress biology. However, modern studies include the identification of key genes that influence stress tolerance and

plant growth under the imposing stress and the verification of gene functions using knock out mutants or overexpression lines In addition genomics has become a necessary tool for the understanding of plant stress responses at the whole genome levels The identification of stress tolerant plant resources and the investigation of the functional role of the genetic variants is also a valuable tool in this research field Recently the advent of CRISPR Cas genome editing technology enables these variations to be introduced in crops for improved stress tolerance traits Through the understanding of the molecular mechanisms involved in plant signaling in response to abiotic stress and crop performance characters under stress conditions we hope to open new ways for the breeding of superior crops

Frontiers of Sulfur Metabolism in Plant Growth, Development, and Stress Response Stanislav Kopriva, Dibyendu Talukdar, Hideki Takahashi, Rüdiger Hell, Agnieszka Sirko, Stanislaus F. D' Souza, Tulika Talukdar, 2016-09-07 Growing plants have a constitutive demand for sulfur to synthesize proteins, sulfolipids, and other essential sulfur containing molecules for growth and development. The uptake and subsequent distribution of sulfate is regulated in response to demand and environmental cues. The importance of sulfate for plant growth and vigor, and hence crop yield and nutritional quality for human and animal diets, has been clearly recognized. The acquisition of sulfur by plants, however, has become an increasingly important concern for the agriculture due to the decreasing S emissions from industrial sources and the consequent limitation of inputs from atmospheric deposition. Molecular characterization involving transcriptomics, proteomics, and metabolomics in *Arabidopsis thaliana* as well as in major crops revealed that sulfate uptake, distribution, and assimilation are finely regulated depending on sulfur status and demand, and that these regulatory networks are integrated with cell cycle, photosynthesis, carbohydrate metabolism, hormonal signaling, uptake, and assimilation of other nutrients, etc. to enable plant growth, development, and reproduction even under different biotic and abiotic stresses. This knowledge can be used to underpin approaches to enhance plant growth and nutritional quality of major food crops around the world. Although considerable progress has been made regarding the central role of sulfur metabolism in plant growth, development, and stress response, several frontiers need to be explored to reveal the mechanisms of the cross talk between sulfur metabolism and these processes. In this research topic, the knowledge on plant sulfur metabolism is reviewed and updated. Focus is put not only on molecular mechanisms of control of sulfur metabolism but also on its integration with other vital metabolic events. The topic covers 4 major areas of sulfur research: sulfate uptake, assimilation, and metabolism; regulation and role in stress response. We hope that the topic will promote interaction between researchers with different expertise and thus contribute to a more integrative approach to study sulfur metabolism in plants.
