Huggins, 2010-09-01 Introduction Energy is necessary for a number of reasons the most basic and obvious involve the preparation of food and the provision of heat to make life comfortable or at least bearable Subsequently a wide range of technological uses of energy have emerged and been developed so that the availability of energy has become a central issue in society The easiest way to acquire useful energy is to simply find it as wood or a hydrocarbon fossil fuel in nature But it has often been found to be advantageous to convert what is simply available in nature into more useful forms and the processing and conversion of raw materials especially petrochemicals have become a very large industry Wood Wood has been used to provide heat for a great many years In some cases it can be acquired as needed by foraging or cutting followed by simple collection When it is abundant there is relatively little need for it to be stored However many societies have found it desirable to collect more wood than is immediately needed during warm periods during the year and to store it up for use in the winter when the needs are greater or its collection is not so convenient One can still see this in some locations such as the more remote communities in the Alps for example One might think of this as the oldest and simplest example of energy storage
