Free Zone Scientology Aled Thomas, 2021-04-08 In this novel academic study Aled Thomas analyses modern issues surrounding boundaries and fluidity in contemporary Scientology By using the Scientologist practice of auditing as a case study this book explores the ways in which new types of Scientologies can emerge The notion of Free Zone Scientology is characterised by its horizontal structure in contrast to the vertical hierarchy of the institutional Church of Scientology With

this in mind Thomas explores the Free Zone as an example of a developing and fluid religion directly addressing questions concerning authority leadership and material objects This book by maintaining a double focus on the top down hierarchy of the Church of Scientology and the horizontal fluid nature of the Free Zone breaks away from previous research on new religions which have tended to focus either on new religions as indices of broad social processes such as secularization or globalization or as exemplars of exotic processes such as charismatic authority and brainwashing Instead Thomas adopts auditing as a method of providing an in depth case study of a new religion in transition and transformation in the 21st century This opens the study of contemporary and new religions to a series of new questions around hybrid religions sacred and secular and acts as a framework for the study of similar movements formed in recent decades

Subsurface Solute Transport Models and Case Histories Vyacheslav G. Rumynin,2012-01-14 The book addresses the development of the basic knowledge of the subsurface solute transfer with a particular emphasis on field data collection and analysis coupled with modeling analytical and numerical tool application The relevant theoretical developments are concerned mainly with the formulation and solution of deterministic mass transport equations for a wide range of engineering issues in groundwater quality assessment and forecasting The book gives many computational examples and case studies drawn from the conducted field investigations The analyzed problems are as follows investigation and prediction of groundwater contamination by industrial contaminants and solutions radionuclides chloride and nitrate brine with special focus on the effect of a aquifer heterogeneity anisotropy and dual porosity b density contrast existing between industrial waste and groundwater or in density stratified artesian and coastal groundwater systems c physicochemical interactions that play a major role in retarding e g adsorption or enhancing e g interactions between dissolved species and mobile colloids contaminant transport prediction of the effects of pumping on groundwater quality at wellfields groundwater dating using stable and radioactive isotopes for prediction and assessment of contamination potential field and laboratory tests design and analysis and monitoring data interpretation partitioning of surface and subsurface flows using isotope techniques One of the most essential topics addressed in the book is the migration and fate of radionuclides Model development is motivated by field data analysis from a number of radioactively contaminated sites in the Russian Federation near surface radioactive waste disposal sites and deep well radioactive waste injection sites They play a unique role in the advancement of knowledge of the subsurface behavior and fate of many hazardous radionuclides and can be considered as field scale laboratories Thus the book along with theoretical findings contains field information which will facilitate the understanding of subsurface solute transport and the development of a methodology for practical applications to groundwater hydrology
