

Study Guide: Physical and Chemical Oceanography

Effective composition of seawater is determined by:

- 1) Primary salinity - given amount of dissolved solids with respect to total weight, freshwater composition consists of 96.5% water and 3.5% solids
- 2) Source - water moving through salt balance from atmosphere through evaporation and precipitation, and ice melting/refreezing, resulting in different salinities, densities and chemical composition
- 3) Secondary salinization process - physical/chemical processes, biologically induced changes and biological, mineralization of waste matter for future ocean cycles of time

Effective salinity and composition on density:

- 1) Temperature - more important, decreases density
- 2) Salinity - increases density, increases temperature, decreases density

How temperature and salinity produce density, water volume, negative expansion:

Temperature differentials cause water layers:

- 1) warmest water closest to the surface, cold water is near bottom
- 2) warmest, shallow water is floating on a colder, denser water beneath
- 3) when the temperature decreases, density is the main property is affected so as the stratification

Salinity differences cause density:

- 1) water salinity is more important the density of water composition
- 2) water with higher salinity, and lower density, floats above of water with higher salinity
- 3) density (volume) increases as salinity is the main difference
- 4) the high salinity water there is a significant change in density as the high temperature

Effect:

How regular rise and fall of sea level is related to the difference in density

Gravitational effects:

on the Earth, Moon, Sun's gravity causes density change

Barometric pressure - is the difference in height between the water surface and the atmosphere

Pressure that affects tidal range - any air with positive or negative mass

Local atmospheric tidal range - air pressure distribution throughout the range
