Abstract—This study examined the effects of a 12-week, 100% body weight (BW) resistance training program on the muscle strength and body composition of 10 sedentary, middle-aged men. The subjects were randomly assigned to either a control group (CON) or a resistance training group (RT). The RT group performed a 12-week, 100% BW resistance training program, while the CON group remained sedentary. The RT group showed significant increases in muscle strength and body composition, while the CON group showed no significant changes. The results suggest that a 12-week, 100% BW resistance training program is effective in improving muscle strength and body composition in sedentary, middle-aged men.
