Int. du Béton,2014 In 1994 fib Commission 6 Prefabrication edited a successful Planning and Design Handbook that ran to approximately 45 000 copies and was published in Spanish and German Nearly 20 years later Bulletin 74 brings that first publication up to date It offers a synthesis of the latest structural design knowledge about precast building structures against the background of 21st century technological innovations in materials production and construction With it we hope to help architects and engineers achieve a full understanding of precast concrete building structures the possibilities they offer and their specific design philosophy It was principally written for non seismic structures The handbook contains eleven chapters each dealing with a specific aspect of precast building structures The first chapter of the handbook highlights best practice opportunities that will enable architects design engineers and contractors to work together towards finding efficient solutions which is something unique to precast concrete buildings The second chapter offers basic design recommendations

that take into account the possibilities, restrictions and advantages of precast concrete along with its detailing, manufacture, transport, erection and serviceability stages. Chapter three describes the precast solutions for the most common types of buildings such as offices, sports stadiums, residential buildings, hotels, industrial warehouses and car parks. Different application possibilities are explored to teach us which types of precast units are commonly used in all those situations. Chapter four covers the basic design principles and systems related to stability. Precast concrete structures should be designed according to a specific stability concept unlike cast in situ structures. Chapter five discusses structural connections. Chapters six to nine address the four most commonly used systems or subsystems of precast concrete in buildings, namely portal and skeletal structures, wall frame structures, floor and roof structures and architectural concrete facades. In chapter ten, the design and detailing of a number of specific construction details in precast elements are discussed, for example supports, corbels, openings and cutouts in the units, special features related to the detailing of the reinforcement and so forth. Chapter eleven gives guidelines for the fire design of precast concrete structures. The handbook concludes with a list of references to good literature on precast concrete construction.

Prefabricated Metal Buildings and Houses, Building Panels and Structural Products Manufacturing , *Components and Systems* Gerald Staib, Andreas Dörrhöfer, Markus Rosenthal, 2013-01-07. Construction systems reduced to the smallest possible number of identical elements have long been used by architects to build structures as well as dismantle and change them as quickly, efficiently and economically as possible. Think of the architecture of the nomads, the Crystal Palace designed by the architect John Paxton for the London World's Fair of 1851 or the modern construction systems of the nineteenth and twentieth centuries in steel, concrete and wood. Coupled with modern digital planning and production methods, modular precast construction systems that are adaptable for many combinations and capable of being combined with one other will play an increasingly important role in architecture in the future. The volume *Components and Systems* offers an in-depth and clearly organized presentation of the various types of precast building components from semifinished products to building with components open and closed, systems and skeleton and panel construction all the way to spatial cell constructions. The systems are accompanied by detailed drawings and color photographs. Discussions of transporting and assembling the various systems round off the topic and make this book an indispensable practical companion. Seit jeher werden in der Architektur auf möglichst wenige gleiche Elemente reduzierte Bausysteme verwendet, um möglichst schnell, effizient und ökonomisch ein Bauwerk errichten oder auch abbauen und verändern zu können. Man denke an die Architektur der Nomaden, den Kristallpalast der 1851 anlässlich der in London stattfindenden Weltausstellung von dem Architekten John Paxton entworfen wurde oder die modernen Bausysteme des 19. und 20. Jahrhunderts in Stahl, Beton oder Holz. Elementierte vorgefertigte für viele Kombinationen anpassungsfähige und untereinander kombinierbare Systeme werden zukünftig gekoppelt mit modernen digitalen Planungs- und Produktionsmethoden einen immer wichtigeren Aspekt in der Architektur darstellen. Der neue Band *Elemente und Systeme*
