Observing Human Traits Lab

Background: Physical traits are observable characteristics that are determined by genes. Genes are specific segments of DNA located on chromosomes that code for a particular trait. Most genes have two or more variations called alleles. Some alleles are dominant over others and dominant alleles will be expressed (an organism's phenotype or physical appearance) over recessive alleles. Recessive alleles may be present in an organism but expression is masked in the presence of a dominant allele for the same gene. Recessive traits are only expressed when there are two recessive alleles present in the genotype (DNA code).

Keep in mind that it's not always quite this simple. There are other factors that influence expression, and most traits have several genes that influence them. This is an introduction to dominant and recessive traits. Let's get started!

Directions: Circle the phenotype you have for each of the following traits.

Microbiological Safety in U.S. and Foreign Laboratories G. Briggs Phillips, 1961 A study of microbiological safety in 102 laboratories in 18 countries shows that methods used to control laboratory accidents and illnesses vary widely and that only a few laboratories are reasonably successful Considering the various available approaches for improving safety in the handling of infectious microorganisms there is need for critical experimental evaluation to determine under what conditions improvements are or are not desirable and the effectiveness of those changes made Of special interest to the Department of the Army would be the ability of laboratories throughout the free world to operate safely with infectious microorganisms under non peacetime conditions Through continued analysis of the world wide status of microbiological safety and through improved communications with foreign laboratories the Biological Laboratories could gather information applicable in its safety program and make a significant contribution to the ability of other laboratories to safely carry out biological defense programs Author

science on a number of fronts from improving forecasts of severe storms and air quality to constraining estimates of trace gas emissions and transport. Understanding the BL is a crucial component of model advancements and increased societal demands for extended weather impact forecasts from hours to months and beyond highlight the need to advance Earth system modeling and prediction. New observing technologies and approaches including in situ and ground based airborne and satellite remote sensing have the potential to radically increase the density of observations and allow new types of variables to be measured within the BL which will have broad scientific and societal benefits. In October 2017 the National Academies of Sciences Engineering and Medicine convened a workshop to explore the future of BL observations and their role in improving modeling and forecasting capabilities. Workshop participants discussed the science and applications drivers for BL observation emerging technology to improve observation capabilities and strategies for the future. This publication summarizes presentations and discussions from the workshop.
