

Physical Science Module 2 Review Paper

- As is true for all other forms of light, ultraviolet light is also made up of photons. The only difference between ultraviolet and visible light is the frequency of the photons. Ultraviolet photons have a higher frequency than visible photons, which means they have more energy. This is why ultraviolet light can cause sunburns and other skin damage, while visible light cannot. The energy of a photon is directly proportional to its frequency, so higher frequency means higher energy. This is why ultraviolet light is more harmful than visible light. The photons in ultraviolet light have enough energy to break the bonds in the molecules of your skin, which can lead to sunburn and other damage. Visible light photons do not have enough energy to do this. The difference in energy between ultraviolet and visible light is what makes ultraviolet light so much more dangerous than visible light. The photons in ultraviolet light have a higher frequency and therefore more energy than the photons in visible light.
