

# Moon Note-Taking Guide

Why do we see the same face of the moon?

Because the moon rotates around its own axis at the same rate that it orbits Earth, we always see the same side of the moon. This is called synchronous rotation. The moon's rotation period is 27.3 days, and its orbital period is also 27.3 days. This is a result of the fact that the moon was formed from the same material that formed Earth, and it has remained in the same position relative to Earth since then.

Why does the moon have craters?

The moon has many craters because it has been hit by many objects over its long history. The moon's surface is covered in craters of various sizes, from small pebbles to large basins. The number of craters on the moon is much greater than on Earth because Earth's atmosphere and oceans have protected the surface from many of the impacts.

The Moon's Surface

The Moon

[6]

The moon's surface is covered in craters of various sizes, from small pebbles to large basins. The number of craters on the moon is much greater than on Earth because Earth's atmosphere and oceans have protected the surface from many of the impacts. The moon's surface is also covered in a layer of dust and small rocks called regolith. This regolith is the result of billions of years of impacts and weathering.

As the amount of reflected light decreases, the moon's surface appears darker. This is why the moon's surface is called the "dark side" of the moon. The dark side is the side of the moon that is always facing away from Earth.

By the time the moon has completed 1/4 of its orbit around Earth, its surface appears to be half lit. This is called the first quarter. The first quarter is the first of four main phases of the moon.
