Environment : Problems and Solutions D K Asthana, 2001 For Degree and Post Graduate Students *Population Ecology of Individuals* Adam Lomnicki, 1988-03-21 A common tendency in the field of population ecology has been to overlook individual differences by treating populations as homogeneous units conversely in behavioral ecology the tendency has been to concentrate on how

individual behavior is shaped by evolutionary forces but not on how this behavior affects population dynamics Adam Lomnicki and others aim to remedy this one sidedness by showing that the overall dynamical behavior of populations must ultimately be understood in terms of the behavior of individuals Professor Lomnicki's wide ranging presentation of this approach includes simple mathematical models aimed at describing both the origin and consequences of individual variation among plants and animals The author contends that further progress in population ecology will require taking into account individual differences other than sex age and taxonomic affiliation unequal access to resources for instance Population ecologists who adopt this viewpoint may discover new answers to classical questions of population ecology Partly because it uses a variety of examples from many taxonomic groups this work will appeal not only to population ecologists but to ecologists in general Park Science ,1995 **Commerce Today** ,1971 Population Ecology John H. Vandermeer, Deborah Esther Goldberg, 2003 How can the future number of deer agricultural pests or cod be calculated based on the present number of individuals and their age distribution How long will it take for a viral outbreak in a particular city to reach another city five hundred miles away In addressing such basic questions ecologists today are as likely to turn to complicated differential equations as to life histories a dramatic change from thirty years ago Population ecology is the mathematical backbone of ecology Here two leading experts provide the underlying quantitative concepts that all modern day ecologists need John Vandermeer and Deborah Goldberg show that populations are more than simply collections of individuals Complex variables such as the size distribution of individuals and allotted territory for expanding groups come into play when mathematical models are applied The authors build these models from the ground up from first principles using a much broader range of empirical examples from plants to animals from viruses to humans than do standard texts And they address several complicating issues such as age structured populations spatially distributed populations and metapopulations Beginning with a review of elementary principles the book goes on to consider theoretical issues involving life histories complications in the application of the core principles statistical descriptions of spatial aggregation of individuals and populations as well as population dynamic models incorporating spatial information and introductions to two species interactions Complemented by superb illustrations that further clarify the links between the mathematical models and biology Population Ecology is the most straightforward and authoritative overview of the field to date It will have broad appeal among undergraduates graduate students and practicing ecologists *Research Reports* United States. Commission on Population Growth and the American Future, 1972 **Population Ecology** Udo Halbach, Jürgen Jacobs, 1979 *National Library of Medicine Current Catalog* National Library of Medicine (U.S.), 1971 Animal Conservation Ethics and the Population Problem Leif Brostrom DeVaney, 2025-07-26 In this book Leif DeVaney brings the traditional philosophical branches of metaphysics and ethics to bear on conservation biology While many previous attempts at asking and answering ethical questions related to conservation and other environmentally relevant activities exist few such attempts have engaged

adequately with the rock bottom approach of metaphysics Through this metaphysically realistic lens the ontological status of the population as well as other ecological wholes is challenged DeVaney argues that individual nonhuman animals are found to have interests that parallel human interests These include the biotic goals of survival and reproduction as well as freedom from undue pain and suffering From an ethical standpoint the conclusion differs drastically from the dominant consequentialist contention that the good of some can be sacrificed for the supposed greater good of the many DeVaney initiates the establishment of the subdiscipline of conservation metaphysics which naturally leads to a theoretically grounded ethic
