Regression Models for Time Series Analysis Benjamin Kedem, Konstantinos Fokianos, 2005-02-25 A thorough review of the most current regression methods in time series analysis Regression methods have been an integral part of time series analysis for over a century Recently new developments have made major strides in such areas as non continuous data where a linear model is not appropriate This book introduces

the reader to newer developments and more diverse regression models and methods for time series analysis Accessible to anyone who is familiar with the basic modern concepts of statistical inference Regression Models for Time Series Analysis provides a much needed examination of recent statistical developments Primary among them is the important class of models known as generalized linear models GLM which provides under some conditions a unified regression theory suitable for continuous categorical and count data The authors extend GLM methodology systematically to time series where the primary and covariate data are both random and stochastically dependent They introduce readers to various regression models developed during the last thirty years or so and summarize classical and more recent results concerning state space models To conclude they present a Bayesian approach to prediction and interpolation in spatial data adapted to time series that may be short and or observed irregularly Real data applications and further results are presented throughout by means of chapter problems and complements Notably the book covers Important recent developments in Kalman filtering dynamic GLMs and state space modeling Associated computational issues such as Markov chain Monte Carlo and the EM algorithm Prediction and interpolation Stationary processes
