

# A Level Maths – Predicted Paper 2B – 2023

| Part | Working or answer an examiner might expect to see                                                  | Mark | Notes                                                                                 |
|------|----------------------------------------------------------------------------------------------------|------|---------------------------------------------------------------------------------------|
| 1)   | For example, for $x = 9.4$<br>$ 3x - 28  = 0.2$ and $(x - 9) = 0.4$                                | M1   | This mark is given for showing that the statement is not true for $9.25 < x < 9.5$    |
|      | The statement is sometimes true;<br>For example, for $x = 12$<br>$ 3x - 28  = 8$ and $(x - 9) = 3$ | A1   | This mark is given for a correct statement and an example where the statement is true |

| Question  | Scheme                                                                                                                                                                                                | Marks | AOs  |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|------|
| 2(a)      | $\frac{\sin 2\theta + \sin \theta}{\cos 2\theta + \cos \theta + 1} = \frac{2 \sin \theta \cos \theta + \sin \theta}{\dots} \quad \text{or} \quad \frac{\dots}{2 \cos^2 \theta - 1 + \cos \theta + 1}$ | M1    | 1.1b |
|           | $\frac{\sin 2\theta + \sin \theta}{\cos 2\theta + \cos \theta + 1} = \frac{2 \sin \theta \cos \theta + \sin \theta}{2 \cos^2 \theta - 1 + \cos \theta + 1}$                                           | M1    | 2.1  |
|           | $= \frac{\sin \theta (2 \cos \theta + 1)}{\cos \theta (2 \cos \theta + 1)} = \tan \theta$                                                                                                             | A1*   | 2.2a |
|           |                                                                                                                                                                                                       | (3)   |      |
| (b)       | $\frac{\sin 2x + \sin x}{\cos 2x + \cos x + 1} = 2 \cos x \Rightarrow 4 \tan x = 2 \cos x$<br>$\Rightarrow \sin x = 2 \cos^2 x = 2(1 - \sin^2 x)$                                                     | M1    | 3.1a |
|           | $\Rightarrow 2 \sin^2 x + \sin x - 2 = 0$                                                                                                                                                             | A1    | 1.1b |
|           | $\sin x = \frac{-1 \pm \sqrt{17}}{4} \quad (0.780\dots, -1.280\dots) \Rightarrow x = \dots$                                                                                                           | dM1   | 1.1b |
|           | $x = 0.896, \quad 2.246$                                                                                                                                                                              | A1    | 1.1b |
|           |                                                                                                                                                                                                       | A1    | 1.1b |
|           |                                                                                                                                                                                                       | (5)   |      |
| (8 marks) |                                                                                                                                                                                                       |       |      |
