Journal U.S. Coast and Geodetic Survey,1948 *Inhibition in the process of feature binding* Snehlata Jaswal, Feature binding is the process whereby different features such as shape colour size orientation location etc are linked together to form a coherent representation of the object It is a ubiquitous physiological sequence and an essential phase in information processing for it provides the basis of mental representations which in turn are requisite for all cognitive functions It is important to realize though that binding is not an isolated process There are myriad stimuli impinging on our senses at all times vying to gain entry into our consciousness Further not only does sensory input emanate from a complex dynamic environment but it also enters a neural system that is already activated by previous inputs and is oriented towards future goals Which aspects of the momentary sensory input are selected for further processing depends as much on the state of the system as it does on the sensory input itself Indeed some fundamental questions one may ask about binding are whether why and how some features are selected for binding at the cost of others The bottom up view of information processing is that the input received by the brain is processed in a largely automatic way to the higher centers in the brain The physiological basis of binding is postulated to be either conjunctively coding neurons or synchrony among participating neural networks to

encode features and out of phase neural activity to encode separate objects But mere perceptual integration of features whether by synchrony or by specialized neurons does not even begin to capture the implication that binding results in coherent objects fundamental for further information processing An object is not only a bundle of features At the very least the features need to be integrated so that the object can be distinguished from other objects This implies selection and manipulation of the basic information supplied by separate features The top down view of information processing contends that binding is more influenced by the reentrant processes the downward and lateral feedback to the lower areas emanating from the higher centers of the brain Reentrant processes not only help to confirm what is correct but also resolve competition These top down processes are linked to attention and higher cognitive functions help select relevant input We aim to debate what happens to the irrelevant information in the process of binding Are irrelevant features simply lost from the system over time or are they deliberately deleted Is there any inhibitory process involved in binding What is the empirical evidence for such a process at the behavioral level Is such a process active and resource demanding or relatively passive and automatic What do neuropsychological studies show What are the physiological underpinnings of such a process How is it incorporated in computational models to increase our understanding of the binding process The idea is to bring together diverse views on Inhibition in Feature Binding with the ultimate aim of better understanding the process of binding and invoking informed and insightful future research

Human Perception Marco Bertamini, Michael Kubovy, 2018-05-08 It takes little or no effort for us to gather information by means of our senses but it would be a mistake to take this as a sign that perception is simple It was in the 20th century and after the establishment of psychology as a scientific discipline that the study of perception flourished This important volume gathers together a selection of articles and essays which represent some of the most interesting discoveries and theories It gives a flavour of the many different approaches and ideas taken by cognitive psychologists in this fascinating area Topics covered include attention brain systems object interpolation and completion object recognition and classification different types of objects and information processing and models
