out regarding the optimization of efficiency The increase in thermal efficiency particularly involves the introduction of high performance alloys Such alloys are for example titanium alloys Sink electrical discharge machining sink EDM is a crucial manufacturing process for components due to its independence of machined material strengths however new materials require process design Hence research to understand and optimize the machining of titanium alloys is of great benefit to the industry in general A positive tool polarity is generally adopted in sink EDM to maximize material removal relative to tool wear Sink EDM of titanium alloys as Ti6Al4V is however atypical in that these materials necessitate a negative tool polarity Adding to the intrigue are gamma titanium aluminides TiAl which machine better under the conventional positive polarity Established explanatory models of sink EDM fail in resolving the removal behavior a need for fundamental research is given This thesis focuses on clarifying the phenomena behind this interesting behavior by investigating removal mechanisms over a range of relevant process conditions. The polarity effect is demonstrated to arise from the polarity dependent nature and extent of titanium carbide TiC formation on the workpiece surface which significantly affects material removal mechanisms An explanatory model deduced from different experimental and numerical approaches clarifies the influence of polarity to the formation mechanism of a TiC layer With regard to monitoring of adverse layer formations the measurement of acoustic emission AE is proven an appropriate concept A correlation of the AE signal to process forces is even established which may be crucial to determine the deflection of thin electrodes in EDM Finally the knowledge acquired is applied and enhanced in comprehensive process design that also involves the machining of additively manufactured TiAl The study reveals the beneficial behavior of the fine microstructure relative to the resulting surface integrity As a result this thesis delivers a model based concept for process design with respect to the adequate choice of tool polarity during machining of titanium alloys

Fluid Mechanics and Thermodynamics of Turbomachinery S. Larry Dixon, Cesare Hall, 2010-02-17 Turbomachinery is a challenging and diverse field with applications for professionals and students in many subsets of the mechanical engineering discipline including fluid mechanics combustion and heat transfer dynamics and vibrations as well as structural mechanics and materials engineering Originally published more than 40 years ago Fluid Mechanics and Thermodynamics of Turbomachinery is the leading turbomachinery textbook Used as a core text in senior undergraduate and graduate level courses this book will also appeal to professional engineers in the aerospace global power oil gas and other industries who are involved in the design and operation of turbomachines For this new edition author S Larry Dixon is joined by Cesare Hall from the University of Cambridge whose diverse background of teaching research and work experience in the area of turbomachines is well suited to the task of reorganizing and updating this classic text Provides the most comprehensive coverage of the fundamentals of turbomachinery of any text in the field Content has been reorganized to more closely match how instructors currently teach the course with coverage of fluid mechanics and thermodynamics moved to the front of the book Includes new design studies of several turbomachines applying the theories developed in the book
