The Hypertrophied Heart Nobuakira Takeda,Makoto Nagano,Naranjan S. Dhalla,2000-09-30 Whenever the heart is challenged with an increased work load for a prolonged period it responds by increasing its muscle mass a phenomenon known as cardiac hypertrophy Although cardiac hypertrophy is commonly seen under physiological conditions such as development and exercise a wide variety of pathological situa tions such as hypertension pressure overload valvular defects volume overload myocardial infarction muscle loss and cardiomyopathy muscle disease are also known to result in cardiac hypertrophy Various hormones such as catecholamines thyroid hormones angiotensin II endothelin and growth factors have also been shown to induce cardiac hypertrophy Although the exact mechanisms underlying or pathological forrnns of cardiac hypertrophy are poorly under the physiological stood an increase in the intraventricular pressure is believed to represent the major stimulus for the development of cardiac hypertrophy In this regard stretching of the cardiac muscle has been shown to induce the hypertrophic response but the role of metabolic influences in this process cannot be ruled out Furthermore different hormones and other interventions in the absence of stretch have been observed to stimulate protein synthesis in both isolated cardiomyocyte and vascular myocyte preparations Nonetheless it is becoming dear that receptor as well as phospholipid linked signal transduction pathways are activated in some specific manner depend ing upon the initial hypertrophic stimulus and these then result in an increase in the size and mass of cardiomyocytes *Revista de Microbiologia* ,1992 Microscopy and Analysis ,1995 Industrial Photography ,1993
