for this month.

It is a proven fact that with our smaller displacement model engines, a single cylinder engine will develop more power than an equivalent displacement twin; more so with a 2-stroke engine than with a 4-stroke. This is due mainly to the additional

power spread between a single cylinder and twin cylinder engine considerably closer. However, things are a bit different with the Saito FA-130 twin in that a single throw crankshaft is used with both cylinder and rod assemblies connected to the same crank pin which results in a

If you take two .65 cubic inch displacement single cylinder 4-stroke engines noted for their high level of performance and join them together with a common crankcase and crankshaft, what do you have? You're right—a real strong running 1.3 cubic inch displacement 4-stroke twin. This is basically what Saito has done with their FA-130 twin, the subject of our engine review

parts required and an increase in the frictional drag, although other factors also enter the picture. A single cylinder 4-stroke engine has one power stroke every other revolution of the crankshaft so that there is a lot of "slow down" time between power strokes. An alternate fire 4-stroke twin, on the other hand, has a power stroke every revolution of the crankshaft which tends to make the

rather unorthodox firing sequence. When viewed from the rear, the left hand cylinder fires, the crankshaft rotates 180° and the right hand cylinder fires, then the crankshaft rotates a turn and a half (540°) and the sequence starts again. Even with this unusual firing sequence, the engine is a real powerhouse running right with the more powerful of the single cylinder 1.2 cubic inch 4-stroke

Doyon,2017-05-25 Both the acquisition of new and the modification of previously acquired motor skills are necessary to achieve optimal levels of motor performance in everyday functioning as well as to attain expert performance levels that are evident in sports and arts A multitude of factors have been shown to influence the various stages of the learning process from the acquisition i.e. motor memory encoding to the consolidation and subsequent retention of a skill These factors or modulators can affect learning through online processes taking place during practice of a new motor skill or through offline processes occurring in the absence of task performance i.e. after training sessions Although much of the recent research from various disciplines has placed an increased emphasis on identifying factors that can influence the motor learning process we lack an integrated understanding of online and offline determinants of motor skill behaviours Potential motor learning modulators include but are certainly not limited to stress anxiety attention executive functioning social interaction stimulus response mapping training schedule regimen learning environment vigilance consciousness states including sleep wakefulness or meditation brain stimulation interference as well as resting state brain connectivity Pathological and non pathological i.e. development or aging changes in the brain can also be conceptualized as potential modulators The aim of this Research Topic is to bridge research from the cognitive sensory motor and psychological domains using various behavioural paradigms and neuroimaging techniques in order to provide a comprehensive view of the online and offline modulators of motor learning and how they interact to influence motor performance Critically the overarching goal is to gain a better understanding of how motor behaviour can be optimized We believe that merging research from diverse neuroscientific communities would contribute to fulfilling this goal and potentially highlight possible shared neurophysiological mechanisms influencing motor learning
