

Physical Geology Study Guide for Exam 4

It is recommended that you bring your own pencils and eraser to your exam. It is recommended that you bring your own calculator to your exam. The study guide should be brought to your exam. The study guide should be brought to your exam. The study guide should be brought to your exam.

Answer the following questions:

- 1.1 Describe the hydrologic cycle, components, and processes. The hydrologic cycle is a continuous process that moves water around the planet. It is driven by the sun's energy, which causes water to evaporate from the surface of the ocean and land. The water vapor then condenses into clouds, which release precipitation in the form of rain or snow. This precipitation can then infiltrate the ground, becoming groundwater, or it can flow over the surface, becoming surface water. The hydrologic cycle is a complex system that involves many different processes, including evaporation, condensation, precipitation, infiltration, and runoff.
- 1.2 Define erosion, and the following erosion parts: source, transport, deposition, and sediment. Erosion is the process of wearing away the Earth's surface. It is caused by the action of water, wind, and ice. The parts of erosion are: source (the area where the material is eroded), transport (the movement of the material), and deposition (the area where the material is deposited).
- 1.3 Define drainage basin and divide. A drainage basin is the area of land that drains water into a single body of water. A divide is the boundary between two drainage basins.
- 1.4 Define drainage pattern, characteristics, and differences between different types of drainage patterns. Drainage patterns are the ways in which water flows over the Earth's surface. They are determined by the shape of the land and the distribution of rainfall. There are several different types of drainage patterns, including dendritic, trellis, and rectangular.
- 1.5 Describe how erosion, transportation, and deposition are affected by grain size and velocity. Erosion is the process of wearing away the Earth's surface. It is caused by the action of water, wind, and ice. Transportation is the movement of the eroded material. Deposition is the process of the eroded material being laid down in a new location. Grain size and velocity are important factors that affect all three processes.
- 1.6 Define alluvium. Alluvium is the material that is deposited by a river or stream. It is typically composed of sand, silt, and clay.
- 1.7 Describe how it is controlled by transportation, deposition, and erosion. Alluvium is controlled by the processes of transportation, deposition, and erosion. Transportation is the movement of the eroded material. Deposition is the process of the eroded material being laid down in a new location. Erosion is the process of wearing away the Earth's surface.
- 1.8 Describe the mechanisms causing various erosion types: hydraulic action, solution, abrasion, and deflation. Hydraulic action is the process of water eroding the Earth's surface. Solution is the process of water dissolving the Earth's surface. Abrasion is the process of particles eroding the Earth's surface. Deflation is the process of wind eroding the Earth's surface.
- 1.9 Define the different ways that sediment is transported by a stream: bed load, suspended load, and dissolved load. Sediment is transported by a stream in three ways: bed load, suspended load, and dissolved load. Bed load is the material that is transported along the bottom of the stream. Suspended load is the material that is transported in the water column. Dissolved load is the material that is transported in solution.
