Under Fluctuating Light Michele Grieco, Fiamma Longoni, Stefano Santabarbara, Jeremy Harbinson, 2023-06-27

Photosynthesis is a fundamental process that drives almost all life on Earth and is the motor of agriculture and food production For several decades its basic functioning has been investigated mainly at steady state under constant illumination This approach was necessary to understand the basic mechanisms underlying the light reactions and carbon assimilation However this condition does not reflect the natural environment where plants experience changes in both the intensity and spectrum of irradiance in a wide range of time scales spanning from seconds to several hours In recent years it has become clear that the processes allowing the photosynthetic apparatus to adapt to changes in irradiance are of paramount importance to plant fitness and productivity Therefore increased research effort has been directed towards studying the regulation of photosynthetic activity under fluctuating light i e upon the variation of light intensity or light spectrum This is important for understanding how photosynthetic organisms cope with natural environmental conditions Fluctuating light itself constitutes a potentially stressful condition because depending on the scale of the fluctuation it can transiently generate extreme redox and transthylakoid potentials and forces the photosynthetic machinery to be re adjusted Not surprisingly plants have evolved several mechanisms allowing a prompt response to these normal environmental events In natural environments photosynthetic organisms often have to cope with fluctuating light while experiencing other kinds of

stress such as heat nutrient deficiency drought and pathogen attacks Therefore the study of combined stresses is essential for understanding the acclimation to realistic environmental conditions

Plant Adaptations to Phosphate Deficiency Alex Joseph Valentine,Alejandra Zúñiga-Feest,Aleysia Kleinert,Pablo Cornejo,Vagner A. Benedito,2021-05-18 Phosphate is an essential mineral to all plants and its availability in soils is an increasing challenge for agriculture Phosphate is abundant in soils but its biological availability is often low due to the complexes that it forms with soil minerals and compounds The biological availability of Phosphate is further reduced in acidic soils which represent approximately 40% of earth s arable agricultural lands Agricultural systems compensate Phosphate deficiency with fertilizers coming from the mining of rock phosphate which is estimated to exhaust within the next 50 years For these reasons Phosphate limitations in natural and agricultural ecosystems is going to become a global problem and we urgently need to better understand how plants respond to Phosphate deficiency
