### FLIGHT SYSTEM

The flight system is a complex system of components that are designed to provide the aircraft with the necessary power and control during flight. The system is composed of several major components, including the engine, the propeller, the fuel system, the oil system, the cooling system, and the electrical system.

The engine is the primary power source for the aircraft. It is a four-cylinder, horizontally opposed engine with a displacement of 100 cubic inches. The engine is driven by a propeller which is connected to the crankshaft by a propeller shaft.

The fuel system is responsible for delivering fuel to the engine. It consists of a fuel tank, a fuel pump, and a fuel filter. The fuel pump is driven by the engine and draws fuel from the tank through the filter. The fuel is then delivered to the engine through a fuel line.

The oil system is responsible for lubricating the engine. It consists of an oil tank, an oil pump, and an oil filter. The oil pump is driven by the engine and draws oil from the tank through the filter. The oil is then delivered to the engine through an oil line.

The cooling system is responsible for cooling the engine. It consists of a water pump, a radiator, and a fan. The water pump is driven by the engine and draws water from the radiator. The water is then delivered to the engine through a water line.

The electrical system is responsible for providing power to the aircraft's electrical components. It consists of a battery, a generator, and a voltage regulator. The battery provides power to the starter motor and the ignition system. The generator provides power to the rest of the aircraft's electrical system.
