

What is a Situational Problem in Math? How is it different from a word problem?

The Quebec Educational Program describes a situational problem being “characterized by the need to attain a goal. This objective cannot be instantly achieved, since it is not an exercise involving applications”. It is a situation in which a person is seeking to attain some goal for which a suitable course of action is not immediately apparent (Burns, 2000). There is not usually one right way to get the answer; there is not always one right answer.

A word problem requires children to focus on the meaning of arithmetic operations. The problem is translated into a mathematical sentence, and children do the computation called for in that sentence. There is usually one right way to get the answer; there is always one right answer. (Burns, 2000)

Why do we do teach situational problems? Because in real life situations, we are rarely given all the information needed in one tidy package. There's rarely only one possible method or strategy in real life situations; usually you choose from several viable possibilities. You don't always know for sure if the solution that you choose is the “right” or “best” one; life has no answer book. (Burns, 2000)

“Not all the problems that children deal with in school need be real-life problems. Children also benefit from contrived problem situations that build their problem-solving abilities”. (Burns, 2000)

Making Sense of Word Problems Eric de Corte, Brian Greer, Lieven

Verschaffel, 2000-01-01 Word problems have been a staple of mathematics instruction for centuries yet the rationale for their use has remained largely unexamined A range of findings have shown how students consistently answer them in ways that fail to take account of the reality of the situations described This monograph reports on studies carried out to investigate this suspension of sense making in answering word problems In Part One a wide range of examples documenting the strength of the phenomenon is reviewed Initial surprise at the findings was replaced by a conviction that the explanation lies in the culture of the mathematics classroom specifically the rules implicitly governing the nature and interpretation of the word problem genre This theoretical shift is reflected in Part Two A detailed analysis of the way in which word problems are currently taught in typical mathematical classrooms is followed by reviews of design experiments illustrating how by immersing students in a fundamentally changed learning environment they can acquire what the authors consider to be more appropriate conceptions about and strategies for doing word problems Part Three turns to a wider discussion of theoretical issues a further analysis of the features of the educational system considered responsible for outcomes detrimental to many students understanding and conception of mathematics and suggestions for rethinking the role of word problems within the
