ict is found at lower levels an additional sophisticated process for avoiding it conflict resolution must be invoked and some extra actions such as waiting for synchronization and detouring may have to be added to the plan The conflict resolution process may become costly or fail Even a single conflict if it is difficult to resolve will result in a plan with considerably lower quality than it otherwise would have As a result in multi agent systems the second or third best plans may result in better overall performance

Applications and Innovations in Intelligent Systems XVI Tony Allen, Richard Ellis, Miltos Petridis, 2010-06-07. Swallowing sound recognition is an important task in bioengineering that could be employed in systems for automated swallowing assessment and diagnosis of abnormally high rate of swallowing, aerophagia, 1 which is the primary mode of ingesting excessive amounts of air, and swallowing dysfunction, dysphagia, 2, 5 that may lead to aspiration, choking, and even death. Dysphagia represents a major problem in rehabilitation of stroke and head injury patients. In current clinical practice, videofluoroscopic swallow study (VFSS) is the gold standard for diagnosis of swallowing disorders. However, VFSS is a time consuming procedure performed only in a clinical setting. VFSS also results in some radiation exposure. Therefore, various non-invasive methods are proposed for swallowing assessment based on evaluation of swallowing signals recorded by microphones and/or accelerometers and analyzed by digital signal processing techniques. 2, 5 Swallowing sounds are caused by a bolus passing through pharynx. It is possible to

use swallowing sounds to determine pharyngeal phase of the swallow and characteristics of the bolus 2
