TIGER Code Edward P. Petkus,Kenneth J. Graham,NAVAL WEAPONS CENTER CHINA LAKE CA.,1981 TIGER is a digital computer code written in FORTRAN IV for calculating the thermodynamic state of a nonideal heterogeneous system of known composition It was developed at Stanford Research Institute specifically for detonation calculations after experience with the RUBY code at Lawrence Livermore Laboratory and the BKW code at Los Alamos Scientific Laboratory had led to the conclusion that a more versatile code was required to perform routine and research calculations on condensed explosives While RUBY is limited by its inability to treat certain explosive compositions both RUBY and BKW are restricted by the inflexibility of their interlocking subroutines which for example prevent use of a new equation of state in a calculation without complete reprogramming The TIGER code was constructed to avoid the problems associated with interdependent subroutines The program was written in modular form so that the thermodynamics used to calculate the state the hydrodynamics used to calculate detonation parameters and the equations of state used to describe the properties of the system are treated separately in different parts of the code Because of this separation TIGER can be best described as a general code for calculating the thermodynamic properties of a nonideal heterogeneous mixture described by an arbitrary equation of state with the capability of calculating detonation parameters provided by the hydrodynamic option
