This edition of the highly respected and well-known book for Engineering Mechanics focuses on developing a solid understanding of basic principles rather than rote learning of specific methodologies. It covers fundamental principles instead of cookbook problem solving and has been refined to make it more readable. It includes over 500 new problems, rigorously checked for accuracy. Statics topics covered include fundamentals of mechanics, elements of vector algebra, important vector quantities, equivalent force systems, equations of equilibrium, introduction to structural mechanics, friction, forces, properties of surfaces, moments, and products of inertia, and methods of virtual work and stationary potential energy. Dynamics topics include kinematics of a particle, particle dynamics, energy methods for particles, methods of momentum for particles, kinematics of rigid bodies, kinetics of plane motion of rigid bodies, energy and impulse-momentum methods for rigid bodies, dynamics of general rigid body motion, and vibrations. **Whitaker's Cumulative Book List**, 1983. 1990, کتابخانه ملی ایران

concerns the relationship between design variables available to the design engineer and structural responses determined by the laws of mechanics. The dependence of response measures such as displacement, stress, strain, natural frequency, buckling load, acoustic response, frequency response, noise, vibration, harshness (NVH), thermo elastic response, and fatigue life on the material property, sizing, component shape, and configuration design variables is defined through the governing equations of structural mechanics. In this 2 volume set, first and second order design sensitivity analyses are presented for static and dynamics responses of both linear and nonlinear elastic structural systems including elasto plastic and frictional contact problems. Book I introduces structural design concepts that include the CAD based design model, design parameterization, performance measures, costs, and constraints. It also discusses design sensitivity analysis of linear structural systems and discrete and continuum design sensitivity analysis methods.
