Meeting, 2004-09-03 This book celebrates 20 years of MRS symposia on the topic of amorphous silicon Contributors showed that the simplified theories developed to explain the limited experimental information available in the early eighties have spurred more sophisticated experimentation either refining the early understanding or making it irrelevant The differences of opinion that continue to exist and emerge are probably the hallmark of the amazing vitality of this field Applications range from mature thin film transistors solar cells and image sensors to the emerging possibility of erbium doped nanocrystalline silicon based materials for lasers and amorphous silicon quantum dots for luminescent devices The book discusses material characterization growth processes and devices Each chapter is further subdivided into sections that group papers around common themes Topics include nanomaterials electronic structure metastable effects understanding of growth processes laser induced crystallization metal induced crystallization other growth techniques newer devices solar cells and thin film transistors **MASA** Betty Hamilton, Barbara Guidos, 1988 **Springer Handbook of Electronic and Photonic Materials** Safa Kasap, Peter Capper, 2017-10-04 The second updated edition of this essential reference book provides a wealth of detail on a wide range of electronic and photonic materials starting from fundamentals and building up to advanced topics and applications Its extensive coverage with clear illustrations and applications carefully selected chapter sequencing and logical flow makes it very different from other

electronic materials handbooks It has been written by professionals in the field and instructors who teach the subject at a university or in corporate laboratories The Springer Handbook of Electronic and Photonic Materials second edition includes practical applications used as examples details of experimental techniques useful tables that summarize equations and most importantly properties of various materials as well as an extensive glossary Along with significant updates to the content and the references the second edition includes a number of new chapters such as those covering novel materials and selected applications This handbook is a valuable resource for graduate students researchers and practicing professionals working in the area of electronic optoelectronic and photonic materials

Cumulated Index Medicus, 1985 *Non-Equilibrium Charge Motion in Organic Solar Cells* Armantas

Melianas, 2017-04-18 Organic photovoltaic OPV devices based on semiconducting polymers and small molecules allow for a low cost alternative to inorganic solar cells Recent developments show power conversion efficiencies as high as 10 12% highlighting the potential of this technology Nevertheless further improvements are necessary to achieve commercialization To a large extent the performance of these devices is dictated by their ability to extract the photo generated charge which is related to the charge carrier mobility Various time resolved and steady state techniques are available to probe the charge carrier mobility in OPVs but often lead to different mobility values for one and the same system Despite such conflicting observations it is generally assumed that charge transport in OPV devices can be described by well defined charge carrier mobilities typically obtained using a single steady state technique This thesis shows that the relevance of such well defined

mobilities for the charge separation and extraction processes is very limited. Although different transient techniques probe different time scales after photogeneration, they are mutually consistent as they probe the same physical mechanism governing charge motion: gradual thermalization of the photo-generated carriers in the disorder-broadened density of states (DOS). The photo-generated carriers gradually lose their excess energy during transport to the extracting electrodes but not immediately. Typically, not all excess energy is dissipated as the photo-generated carriers tend to be extracted from the OPV device before reaching quasi-equilibrium. Carrier motion is governed by thermalization, leading to a time-dependent carrier mobility that is significantly higher than the steady-state mobility. This picture is confirmed by several transient techniques: Time-resolved Terahertz Spectroscopy (TRTS), Time-resolved Microwave Conductance (TRMC) combined with Transient Absorption (TA), electrical extraction of photo-induced charges (photo-CELIV). The connection between transient and steady-state mobility measurements in space-charge-limited conductivity (SCLC) is described. Unification of transient optoelectric techniques to probe charge motion in OPVs is presented. Using transient experiments, the distribution of extraction times of photo-generated charges in an operating OPV device has been determined and found to be strongly dispersive, spanning several decades in time. In view of the strong dispersion in extraction times, the relevance of even a well-defined time-dependent mean mobility is limited. In OPVs, a continuous percolating donor network is often considered necessary for efficient hole extraction, whereas if the network is discontinuous, hole transport is thought to deteriorate significantly, limiting device performance. Here, it is shown that even highly diluted donor sites (5–7–10 %) in a buckminsterfullerene (C₆₀) matrix enable reasonably efficient hole transport. Using transient measurements, it is demonstrated that hole transport between isolated donor sites can occur by long-range hole tunneling over distances of 4 nm through several C₆₀ molecules, even a discontinuous donor network enables hole transport. **Texas State Directory**, 2007. *Billboard*, 1945-03-31.
