Stochastic Versus Fuzzy Approaches to Multiobjective Mathematical Programming under Uncertainty Shi-Yu

Huang, Jaques Teghem, 2012-12-06 Operations Research is a field whose major contribution has been to propose a rigorous formulation of often ill defined problems pertaining to the organization or the design of large scale systems such as resource allocation problems scheduling and the like While this effort did help a lot in understanding the nature of these problems the mathematical models have proved only partially satisfactory due to the difficulty in gathering precise data and in formulating objective functions that reflect the multi faceted notion of optimal solution according to human experts In this respect linear programming is a typical example of impressive achievement of Operations Research that in its deterministic form is not always adapted to real world decision making everything must be expressed in terms of linear constraints yet the coefficients that appear in these constraints may not be so well defined either because their value depends upon other parameters not accounted for in the model or because they cannot be precisely assessed and only qualitative estimates of these coefficients are available Similarly the best solution to a linear programming problem may be more a matter of compromise between various criteria rather than just minimizing or maximizing a linear objective function Lastly the constraints expressed by equalities or inequalities between linear expressions are often softer in reality than what their mathematical expression might let us believe and infeasibility as detected by the linear programming techniques can often be coped with by making trade offs with the real world Communications United States.
