System operation

The Hydraulic Power Lift (HPL) system is supplied oil by the main hydraulic pump located on the left side of the engine. The hydraulic system pressure of 2000 PSI (138 bar) is regulated by the control relief valve located in the rear mount lift arm valve. This control valve located internally in the HPL housing, routes the oil to a single entry lift cylinder. The lift cylinder controls entry in the main cylinder, causing the lift arms to raise upwards and to the rear side of the three-point hitch. When the HPL is placed in the lower position, the weight on the three-point hitch pushes the oil out of the lift cylinder and the external lift arm valve, which regulates the flow rate of the three-point hitch, and the oil returns to the main reservoir. The HPL system also incorporates a system safety relief valve, with a pressure setting of 1000 PSI (69 bar), which protects the hydraulic system from shock loads produced from the weight on the three-point hitch. The air coupler located on top of the HPL housing releases any air pressure that may be created in the three-point hitching.
