architecture is often the endpoint of bone biology experiments being clinically relevant to bone fracture How and why does bone travel along its complex spatio temporal trajectory to acquire its architecture The question why can have two meanings The first teleological why is an architecture advantageous is the domain of substantial biomechanical research to date The second etiological how did an architecture come about has received far less attention This Frontiers Bone Research Topic invited contributions addressing this etiological why what mechanisms can coordinate the activity of bone forming and resorbing cells to produce the observed complex and efficient bone architectures One mechanism is proposed chaotic nonlinear pattern formation NPF which underlies in a unifying way natural structures as disparate as trabecular bone swarms of birds flying or shoaling fish island formation fluid turbulence and others At the heart of NPF is the fact that simple rules operating between interacting elements multiplied and repeated many times lead to complex and structured patterns This paradigm of growth and form leads to a profound link between bone regulation and its architecture in bone the architecture is the regulation The former is the emergent consequence of the latter Whatever mechanism does determine bone s developing architecture has to operate at the level of individual sites of formation and resorption and coupling between the two This has implications as to how we understand the effect on bone of agents such as gene products or drugs It may be for instance that the tuning of coupling between formation and resorption might be as important as the achievement of enhanced bone volume The ten articles that were contributed to this Topic were just what we hoped for a snapshot of leading edge bone biology research which addresses the question of how bone gets its shape We hope that you find these papers thought provoking and that they might stimulate new ideas in the research into bone architecture growth and adaptation and how to preserve healthy bone from gestation and childhood until old age **Low Power Circuit Design Using Advanced CMOS Technology** Milin Zhang,Zhihua Wang,Jan Van der Spiegel,2022-09-01 Low Power Circuit Design Using Advanced CMOS Technology is a summary of lectures from the first Advanced CMOS Technology Summer School ACTS 2017 The slides are selected from the handouts while the text was edited according to the lecturers talk ACTS is a joint activity supported by the IEEE Circuit and System Society CASS and the IEEE Solid State Circuits Society SSCS The goal of the school is to provide society members as well researchers and engineers from industry the opportunity to learn about new emerging areas from leading experts in the field ACTS is an example of high level continuous education for junior engineers teachers in academe and students ACTS was the results of a successful collaboration between societies the local chapter leaders and industry leaders This summer school was the brainchild of Dr Zhihua Wang with strong support from volunteers from both the IEEE SSCS and CASS In addition the local companies Synopsys China and Beijing IC Park provided support This first ACTS was held in the summer 2017 in Beijing The lectures were given by academic researchers and industry experts who presented each 6 hour long lectures on topics covering process technology EDA skill and circuit and layout design skills The school was hosted and organized by the CASS Beijing Chapter SSCS Beijing Chapter and SSCS Tsinghua

Student Chapter The co chairs of the first ACTS were Dr Milin Zhang Dr Hanjun Jiang and Dr Liyuan Liu The first ACTS was a great success as illustrated by the many participants from all over China as well as by the publicity it has been received in various media outlets including Xinhua News one of the most popular news channels in China **Applications of Mathematics in Science and Technology** Bui Thanh Hung,M. Sekar,Ayhan ESI,R. who are always more often looking at the potentiality of computer algorithms to find correlations among them Recent developments in the field of Machine Learning ML have proven to be very useful and efficient for automatic discrimination decision prediction clustering and information extraction in many fields including volcanology In recent times Deep Learning has seen rapid growth in its popularity along with other supervised strategies such as Support Vectors Machines and Recurrent neural networks RNN which have consistently been applied with success to broader and broader sets of applications and fields However supervised machine learning requires labels for training and obtaining these labels for large volumes of seismic and volcanic data is a very demanding and challenging task Therefore semi supervised and unsupervised methods such as Self organized Maps have been applied with success to extract relevant information from huge amounts of unlabelled data In seismic and deformative data processing these techniques are used for waveform inversion automatic picking of first arrivals and interpretation of peculiar characteristics of transients ML is helpful in the discrimination of magmatic complexes in distinguishing tectonic settings of volcanic rocks in the evaluation of correlations between volcanic signals and the chemico physical composition of erupted materials Other applications of ML in volcanology include the analysis and classification of geological geochemical and petrological static data to infer for example the possible source and mechanism of observed deposits the analysis of satellite imagery to quickly classify vast regions difficult to investigate on the ground or again to detect changes that could indicate an unrest The results obtained with the help of these algorithms would otherwise represent for researchers tasks hard to be solved with the usual standard methodologies **Advancing the use of Eye-Tracking and Pupillometric Data in Complex Environments.** Russell A.
