Explain how water and mineral ions are transported through the plant by transpiration, including the structure and function of the stomata.			Stomata are the spaces on the underside of a leaf through which gases can diffuse. One stoma has been circled on the picture 
			The stomata are opened and closed by guard cells. In the light, water flows into pairs of guard cells making them rigid. This opens the stoma. At night, water flows out of the guard cells. They lose turgidity and the stoma shuts.
