**Polynomial Methods in Optimal Control and Filtering** Kenneth J. Hunt, 1993 This book aims to demonstrate the power and breadth of polynomial methods in control and filtering Direct polynomial methods have previously received little attention compared with the alternative Wiener Hopf transfer function method and the statespace methods which rely on Riccati equations The book provides a broad coverage of the polynomial equation approach in a range of linear control and filtering problems The principal feature of the approach is the description of systems in fractional form using transfer functions This representation leads quite naturally and directly to the parameterisation of all acceptable feedback controllers for a given problem in the form of a Diophantine equation over polynomials In the polynomial equation approach this direct parameterisation is explicitly carried through to the synthesis of controllers and filters and further to the computer implementation of numerical algorithms The book is likely to be of interest to students researchers and engineers with some control and systems theory or signal processing background It could be used as the basis of a graduate level course in optimal control and filtering The book proceeds from the necessary background material presented at a tutorial level through recent theoretical and practical developments to a detailed presentation of numerical algorithms **Algebra Text:**
