R Crompton,2014-05-28 Generally speaking engineering plastics are those which are replacing conventional materials such as metals and alloys in general

engineering In addition the term engineering plastic covers materials that have superior properties which were not particularly available in conventional polymeric materials such as the exceptionally high heat resistance of polyimides and polysulfides In addition to conventional materials engineering polymers include materials as diverse as polyether ether ketone polyimide polyetherimide and polysulfides and polysulfides Engineering polymers can be reinforced by the inclusion in their formulations of glass fibres carbon fibres and nanotubes which produce appreciable improvements in mechanical and thermal properties The book aims to provide a complete coverage of the types of plastics which are now increasingly being used in engineering in applications as diverse as gears aircraft body construction micro electronics and extreme high temperature applications steel replacement and artificial hip joints The book also intends to provide a complete review of the use of polymers in engineering The mechanical electrical and thermal properties of polymers are discussed as are other diverse applications such as solvent and detergent resistance frictional and hardness properties food packaging applications and gas barrier properties In addition a very important application is discussed of the resistance of plastics to gamma and other forms of radiation namely their use in nuclear industry medical applications and food sterilisation The book will be of interest to those at all levels who are concerned with general engineering building automotive aerospace electronics mechanical and nuclear industries It will also be of interest as a source book to materials scientists those concerned with the development of new materials and students of engineering and related studies

Nanolithography and Patterning Techniques in Microelectronics D Bucknall, 2005-09-30 Currently surface patterning is achieved by means of optical lithographic techniques but with industry moving towards the fabrication of devices with size features of 100 nm less the technological community is looking for alternative approaches to materials fabrication at the nanoscale By using nanolithography scientists can drive patterning currents through surfaces while building a 3D structure from a series of patterned layers Electron induced chemical lithography can create ultra high resolution templates for the site selective immobilisation of molecules to form functional hierarchic

Polymer and Composite Rheology, Second Edition, Rakesh K. Gupta, 2000-06-14 An analysis of polymer and composite rheology This second edition covers flow properties of thermoplastic and thermoset polymers and general principles and applications of all phases of polymer rheology with new chapters on the rheology of particulate and fibre composites It also includes new and expanded detail on polymer blends and emulsions foams reacting systems and flow through porous media as well as composite processing operations

Inorganic Biomaterials Xiang C Zhang, 2014-06-26 This book provides a practical guide to the use and applications of inorganic biomaterials It begins by introducing the concept of inorganic biomaterials which includes bioceramics and bioglass This concept is further extended to hybrid biomaterials consisting of inorganic and organic materials to mimic natural biomaterials The book goes on to provide the reader with information on biocompatibility bioactivity and bioresorbability The concept of the latter is important because of the increasing role resorbable biomaterials are playing in implant applications

The book also introduces a new concept on mechanical compatibility mechacompatibility Almost all implant biomaterials employed to date such as metal and ceramic implants do not meet this biological requirement as they have far higher modulus than any biomaterials in the body The practical techniques that are used in the characterization of biomaterials including chemical physical biological microscopy and mechanical characterization are described Some specialised techniques are also introduced such as Synchrotron Micro Computed Tomography u CT and Magnetic Resonance Imaging MRI The reader is given important information on new biomaterials development for orthopaedic and other areas including controlled release technology hydroxyapatite and hybrid bioresorbable materials Finally the book provides a guide to regulatory considerations an area which is often overlooked but is an important part of R D and manufacturing of medical materials and devices
