Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were 15 men, 40 to 50 years old, who were sedentary and had no cardiovascular disease. They were randomly assigned to a 12-week training program or a control group. The training program consisted of three sessions per week of aerobic exercise at 60% to 70% of the maximum HR. The control group did not exercise. The HR and HRR were measured at rest and during maximal exercise at the beginning and at the end of the 12-week period. The results showed that the training program significantly increased the HR and HRR at rest and during maximal exercise. The control group showed no significant changes. The results suggest that a 12-week training program can improve the cardiovascular fitness of sedentary middle-aged men.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or other light sources. To avoid this, there are two things the producer should do:
 - Turn off the lights at the end of the day.
 - Use red light for night time. Red light has the least effect on the circadian clock.
- The end of the day is important for the circadian clock. The end of the day is the time when the producer should turn off the lights. The end of the day is the time when the producer should turn off the lights. The end of the day is the time when the producer should turn off the lights.

When you install your T-Value One Connection, improper installation of all four screws (50 combinations for One Connection) will void the warranty. Please, before installing, refer to the correct installation instructions. Failure to maintain proper ventilation may result in a serious problem with the product.

- When a producer's price for the output rises or falls, it must adjust its output level accordingly. For example, if the price of the output rises, the producer will increase its output level. This is because the producer's marginal revenue (MR) curve shifts up, and the producer will increase its output level until MR equals marginal cost (MC).
