

Physical Science Module 2 Review Paper

- As is true for all other forms of light, ultraviolet light is also made up of photons. The main difference between ultraviolet and visible light is the frequency of the photons. Ultraviolet photons have a higher frequency than visible photons, which means they have a higher energy. This is why ultraviolet light can cause sunburn and other skin damage, while visible light cannot. The energy of a photon is directly proportional to its frequency, so higher frequency means higher energy. This is why ultraviolet light is more harmful than visible light. The photons in ultraviolet light have enough energy to break the chemical bonds in the skin, which can lead to sunburn and other damage. Visible light photons do not have enough energy to do this. The difference in energy between ultraviolet and visible light is what makes ultraviolet light so much more dangerous. This is why it is important to protect your skin from ultraviolet light by wearing sunscreen and avoiding tanning beds. The photons in ultraviolet light are also more likely to be absorbed by the skin than visible photons, which is another reason why it is so harmful. The energy of the photons is what determines how much damage they can do to the skin. The higher the energy, the more damage they can do. This is why ultraviolet light is so much more dangerous than visible light. The photons in ultraviolet light have enough energy to break the chemical bonds in the skin, which can lead to sunburn and other damage. Visible light photons do not have enough energy to do this.
