on different continents can be a powerful tool to better understand the ways in which ecosystems respond to global change. Large areas are often needed to characterize the causal mechanisms governing interactions between ecozones and their environments. Factors such as weather and climate patterns, land-ocean and land-atmosphere interactions all play important roles. As a result of the strong physical north-south symmetry between the western coasts of North and South America, the similarities in climate, coastal oceanography and physiography between these two regions have been extensively documented. *High Latitude Rain Forests and Associated Ecosystems of the West Coast of the Americas* presents current research on West Coast forest and river ecology and compares ecosystems of the Pacific Northwest with those of South America.

Rainforests Kimberly Sidabras, 2018. The world's rainforests have been called the lungs of the Earth because the trees and plants found in rainforest areas produce approximately 40 percent of the world's oxygen. Rainforests are areas of woodland that receive more than 60 to 80 inches (150 to 200 cm) of rain a year. Most rainforest lies in the tropics, but there are also temperate rainforests in many cooler parts of the globe. The world's rainforests are rich in plant, animal and insect life, but they are threatened by development. *THE WORLD'S BIOMES* series provides information on five of the most important large ecological systems in the world today: deserts, grasslands, oceans, rainforests and wetlands. Each book in the series describes the climate, geology, vegetation and animal life found in a particular biome, as well as the modern threats and what people can do about them.
