

Study Guide: Physical and Chemical Oceanography

Effective composition of seawater is determined by:

- 1) Primary salinity - given entirely by composition of source water from which seawater formed (mostly, freshwater composition of rainfall composition)
- 2) Evaporation - water leaving through salt by mass, from atmosphere following atmospheric rules, and no evaporation adjustment, resulting in enriched brackish water and saltier seawater
- 3) Secondary salinization process - the salt enriched composition is further changed by mixing and changes in composition of source water for future source water in time

Effective salinity and composition in salinity:

- 1) Primary - from composition of source water
- 2) Secondary - from evaporation and mixing of source water

How temperature and salinity produce density from water volume expansion/contraction:

Temperature differences cause water to expand:

- 1) warm water volume expands - with same mass more space
- 2) expanded, reduced space is floating in a colder denser water volume
- 3) effect: the temperature difference produces an effect density increase is related to it, the effect is small

Salinity differences cause contraction:

- 1) higher salinity at same mass, the denser the water composition
- 2) water with higher salinity, and lower density, floats above of water with higher salinity
- 3) density (mass) increased for salinity, the denser the water
- 4) the higher the salinity, the denser the water is, the denser the water is, the denser the water is

Effect:

How temperature and salinity of sea water is related to its density is shown below:

Temperature effect:

on the left, the temperature curve shows density change.

Salinity effect: Salinity effect - the effect of salinity on density is shown below.

Temperature effect: Temperature effect - the effect of temperature on density is shown below.

Salinity effect: Salinity effect - the effect of salinity on density is shown below.
