ESPES Manual of Pediatric Minimally Invasive Surgery Ciro Esposito, François Becmeur, Henri Steyaert, Philipp Szavay, 2019-08-02 This book is devoted to all the aspects of pediatric minimally invasive surgery and is written under the patronage of the European Society of Pediatric Endoscopic Surgery ESPES with the participation of leading international experts on Pediatric MIS. Comprising more than 50 chapters, the book begins with an introductory section describing the general and technical aspects of MIS approaches including laparoscopy, thoracoscopy, retroperitoneoscopy, and robotic surgery. The main part of the book is divided into five subsections, each of which focuses on a specific system: thorax, abdomen, urology, gynecology, and varia. For each subsection, the book examines several pathologies, accurately describing their clinical and diagnostic aspects and providing detailed information on the operative techniques, tips, and tricks used in their treatment. Further, the book addresses potential complications in MIS and better ways to manage and prevent them. The volume will be of interest for pediatric surgeons, pediatric urologists, or other professionals that need to access accurate descriptions of the MIS approaches adopted for the different surgical pathologies. At the same time, it addresses the needs of novices, including trainees looking for general information on the management of the various diseases encountered in the pediatric population.

The SAGES Manual of Bariatric Surgery Kevin M. Reavis, Allison M. Barrett, Matthew D. Kroh, 2018-04-04 Morbid obesity is an epidemic as more than 2/3 of the United States population is obese and as such has a high burden of weight-related comorbid diseases. Bariatric surgery has proven to be effective and durable for treatment of severe obesity. Technological advances, including applications of laparoscopy and endolumenal techniques, have rapidly advanced this field. Data and outcomes examining treatments have also improved, and as providers, we have a wide spectrum of therapeutic options to treat patients. As techniques and outcomes have evolved, access to a comprehensive yet focused resource regarding bariatric surgery is currently limited. The proposed textbook is designed to present a comprehensive and state-of-the-art approach to the current and future status of bariatric interventions, which has changed significantly since the first edition of the Manual. Updates in this version will include the rapidly expanding field of endoluminal bariatric procedures with a focus on new devices and theories of mechanisms. New data regarding laparoscopic approaches to treat obesity, as well as improved longer-term data outcomes, will be reviewed. Newer surgical approaches to treat metabolic disease and obesity are included, as well as proposed mechanisms of action and efficacy. Additional new sections include sections on the application of robotic technologies, special circumstances including transplantation and pregnancy, and telemedicine and social media in bariatric surgery. Sections will address the evolution in specific treatments available to patients, initial evaluation and selection of procedures for individual patients, the latest surgical and endoscopic techniques being employed to treat patients, including data on outcomes and future directions for therapy. In particular, and unique amongst references, a major focus of this text will be on both the bariatric and metabolic bases of therapies and outcomes. *The SAGES Manual: A Practical Guide to*

Technology for implementing the latter in a clinical setting is still very much at the research stage. The fourth section focuses on surgical training and skills assessment necessitated by the novelty and complexity of the technologies involved and the need to provide reliable and efficient training and objective assessment in the use of robotic MIS systems. In Volume 2 *Micro and Nano Robotics in Medicine*, a brief historical overview of the field of medical nanorobotics as well as the state of the art in the field is presented in the introductory chapter. It covers the various types of nanorobotic systems, their applications and future directions in this field. The volume is divided into three themes related to medical applications. The first theme describes the main challenges of microrobotic design for propulsion in vascular media. Such nanoscale robotic agents are envisioned to revolutionize medicine by enabling minimally invasive diagnostic and therapeutic procedures. To be useful, nanorobots must be operated in complex biological fluids and tissues which are often difficult to penetrate. In this section, a collection of four papers reviews the potential medical applications of motile nanorobots, catalytic based propelling agents, biologically inspired microrobots, and nanoscale bacteria enabled autonomous drug delivery systems. The second theme relates to the use of micro and nanorobots inside the body for drug delivery and surgical applications. A collection of six chapters is presented in this segment. The first chapter reviews the different robot structures for three different types of surgery: namely laparoscopy, catheterization, and ophthalmic surgery. It highlights the progress of surgical microrobotics toward intracorporeally navigated mechanisms for ultra minimally invasive interventions. Then, the design of different magnetic actuation platforms used in micro and nanorobotics are described. An overview of magnetic actuation based control methods for microrobots with eventually biomedical applications is also covered in this segment. The third theme discusses the various nanomanipulation strategies that are currently used in biomedicine for cell characterization, injection, fusion, and engineering. *In vitro* 3D cell culture has received increasing attention since it has been discovered to provide a better simulation environment of *in vivo* cell growth. Nowadays, the rapid progress of robotic technology paves a new path for the highly controllable and flexible 3D cell assembly. One chapter in this segment discusses the applications of micro/nano robotic techniques for 3D cell culture using engineering approaches. Because cell fusion is important in numerous biological events and applications such as tissue regeneration and cell reprogramming, a chapter on robotic tweezers cell manipulation system to achieve precise laser induced cell fusion using optical trapping has been included in this volume. Finally, the segment ends with a chapter on the use of novel MEMS based characterization of micro scale tissues instead of mechanical characterization for cell lines studies. Volume 3 *Image guided Surgical Procedures and Interventions* focuses on several aspects ranging from understanding the challenges and opportunities in this domain to imaging technologies to image guided robotic systems for clinical applications. The volume includes several contributions in the area of imaging in the areas of X Ray fluoroscopy, CT, PET, MR Imaging, Ultrasound imaging, and optical coherence tomography. Ultrasound based diagnostics and therapeutics as well as ultrasound guided planning and navigation are also included in this volume, in addition to multi

modal imaging techniques and its applications to surgery and various interventions The application of multi modal imaging and fusion in the area of prostate biopsy is also covered Imaging modality compatible robotic systems sensors and actuator technologies for use in the MRI environment are also included in this work as is the development of the framework incorporating image guided modeling for surgery and intervention Finally there are several chapters in the clinical applications domain covering cochlear implant surgery neurosurgery breast biopsy prostate cancer treatment endovascular interventions neurovascular interventions robotic capsule endoscopy and MRI guided neurosurgical procedures and interventions Volume 4 Rehabilitation Robotics is dedicated to the state of the art of an emerging interdisciplinary field where robotics sensors and feedback are used in novel ways to relearn improve or restore functional movements in humans This volume attempts to cover a number of topics relevant to the field The first section addresses an important activity in our daily lives walking where the neuromuscular system orchestrates the gait posture and balance Conditions such as stroke vestibular deficits or old age impair this important activity Three chapters on robotic training gait rehabilitation and cooperative orthoses describe the current works in the field to address this issue The second section covers the significant advances in and novel designs of soft actuators and wearable systems that have emerged in the area of prosthetic lower limbs and ankles in recent years which offer potential for both rehabilitation and human augmentation These are described in two chapters The next section addresses an important emphasis in the field of medicine today that strives to bring rehabilitation out from the clinic into the home environment so that these medical aids are more readily available to users The current state of the art in this field is described in a chapter The last section focuses on rehab devices for the pediatric population Their impairments are life long and rehabilitation robotics can have an even bigger impact during their lifespan In recent years a number of new developments have been made to promote mobility socialization and rehabilitation among the very young the infants and toddlers These aspects are summarized in two chapters of this volume
