

# Chemical Equilibrium Lab

## Introduction:

Some chemical systems reach the equilibrium state exhibiting breaking-forming bonds simultaneously, resulting in a mixture of products and reactants. These systems are called **reversible reactions**, and the reaction can proceed either direction. Thus, the **law of mass action** **applies to both sides of the reversible reaction**, and the **equilibrium constant** **applies to the forward and reverse reactions** as well. Equilibrium constants are expressed in a variety of ways, but the most common is the **equilibrium constant** **expression**, which is a ratio of the concentrations of products to reactants, each raised to the power of its stoichiometric coefficient. The **equilibrium constant** **expression** is a function of temperature only, and is constant for a given reaction. **Le Chatelier's Principle** states that applying stress changes the **equilibrium position** of a reversible reaction in a way that relieves the stress. **Stress** is any change in the conditions of a system that causes it to move away from equilibrium. When stress is applied to a reversible reaction, the **equilibrium** **constant** **expression** **remains constant**, but the concentrations of reactants and products **will change** **in order to maintain the equilibrium constant**. In this lab, you will be observing the changes in equilibrium when the amount of reactants, **pressure**, **temperature**, and **volume** changes in **the following reactions**. **Le Chatelier's Principle** will be used to predict the effect of these changes on the equilibrium position. The **equilibrium constant** **expression** will be used to determine the effect of these changes on the **equilibrium constant** **expression**.

Adding  $\text{NaCl}$  increases  $\text{Cl}^-$  concentration, and will shift the  $\text{PbCl}_2$  to the **right**, **forming the product** **increasing the amount of product** **in the system** **in order to maintain the equilibrium constant** **expression**.
