Intelligent Robotic Systems Tzafestas, 2020-08-26 A multiplicity of techniques and angles of attack are incorporated in 18 contributions describing recent developments in the structure architecture programming control and implementation of industrial robots capable of performing intelligent action and decision making Annotation copyright Book Comparative Design, Modeling and Control Analysis of Robotic Transmissions Hagen Schempf, 1990 Transmission dynamics are shown to dominate the stability and performance of impedance and torque controlled rotary electro mechanical systems The experimental analysis focuses on planetary cycloidal harmonic and cable reducers but excludes direct drive pneumatic hydraulic and friction drives Neither sensors nor actuators with better resolution nor increased dynamic range can circumvent reduced stability and performance limitations unless certain hardware criteria can be met Simple transmission models are proposed to model such effects as 1 transmission stiffness 2 soft zones and wind up 3 backlash and lost motion and 4 stiction friction and viscous losses These models are experimentally verified using six different transmission types most commonly used in robot designs Simple lumped parameter linear nonlinear models are

shown to predict stability margins and bandwidths at these margins fairly closely Simple nonlinear lumped and fixed parameter models were unable to properly predict time responses when the torque signals were of low frequency and amplitude underscoring the complexity in modeling the transmission internal stick slip phenomena The clear distinction between speed reducers and torque multipliers is theoretically and experimentally explored The issue of actuator and sensor colocation is shown to be extremely important in predicting the reduced bandwidth and stability of torque controlled actuator transmission load systems Stiffening transmission behaviors are shown to be of a conditionally stabilizing nature while also reducing the dynamic range of impedance and torque servoed systems System damping whether active or passive as well as low pass filtering motor controller signals are shown to dramatically increase stability without having any effect on increasing system bandwidth Transmission soft zones are proven to reduce the stability margins of colocated impedance controlled electro mechanical systems None of the standard controller structures explored here were able to noticeably increase the system bandwidth of the open loop system without reducing the overall system performance The different transmissions are tested for system nonidealities and generalizations drawn on the stability and performance margins of impedance and torque servoed geared cycloidal planetary and cable reducers in hard contact with the environment Experimental results are furnished which underscore the validity and limitations of the theoretical modeling approach and comparative transmission analysis while highlighting the importance of different physical system parameters necessary for proper transmission design

Human-Aware Robotics: Modeling Human Motor Skills for the Design, Planning and Control of a New Generation of Robotic Devices Giuseppe Averta, 2022-01-25 This book moves from a thorough investigation of human capabilities during movements and interactions with objects and environment and translates those principles into the design planning and control of innovative mechatronic systems providing significant advancements in the fields of human robot interaction autonomous robots prosthetics and assistive devices The work presented in this monograph is characterized by a significant paradigmatic shift with respect to typical approaches as it always place the human at the center of the technology developed and the human represents the starting point and the actual beneficiary of the developed solutions The content of this book is targeted to robotics and neuroscience enthusiasts researchers and makers students and simple lovers of the matter

Machine Learning for Humanoid Robot Modeling and Control Tingfan Wu,2013 Biologically inspired humanoid robots present new challenges for system identification and control due to the presence of many degrees of freedom highly compliant actuators and non traditional force transmission mechanisms In this thesis we address these challenges using machine learning approaches The key idea is to replace classical laborious manual model calibration and motion programming with statistical inference and learning from multi modal sensory data To this end we develop several new parametric models and their parameter identification algorithms enabling new sensor actuator configurations beyond the scope of previous approaches In addition we also develop a semi parametric model to learn from experiences not predicted by the parametric model Using similar approaches grounded in machine learning we also develop methods to allow humanoid robots to learn to make facial expressions kick a ball and to reach for objects while collaborating with people We collected a unique dataset that describes development of infant reaching behavior while interacting with an adult caregiver We compared the observed development of social reaching in human infants with the machine learning based development behavior in a complex humanoid robot
