

Keystone Species

Saguaro Cactus

What is a keystone species?

A keystone species is a species that has a disproportionately large effect on its environment relative to its abundance. The concept was developed by ecologist Robert Paine in 1969, based on his studies of intertidal rocky shore communities.

Keystone species are often predators, but they can also be engineers, mutualists, or other types of organisms. The removal of a keystone species from an ecosystem can have cascading effects on the entire community, often leading to a loss of biodiversity and a change in the structure and function of the ecosystem.

Why is the saguaro a keystone species?

The saguaro cactus is a keystone species in the Sonoran Desert. It provides food and shelter for many animals, including birds, lizards, and insects. The saguaro also plays a role in the desert's water cycle, storing water in its thick stems and releasing it slowly over time.
