## Population dynamics

**Population dynamics**

**Introduction**

Population dynamics is the study of how and why the number of individuals in a population changes over time. It is a branch of biology that deals with the interactions between individuals and their environment, and how these interactions affect the population as a whole.

**Key Concepts**

- Population: A group of individuals of the same species living in the same area at the same time.
- Demography: The study of the statistical characteristics of a population, such as age, sex, and birth and death rates.
- Life History: The sequence of events that an individual organism experiences from birth to death, including growth, reproduction, and mortality.
- Population Growth: The increase in the number of individuals in a population over time.
- Population Regulation: The factors that control the size of a population, such as food availability, predation, and disease.

**Population Growth Models**

The exponential growth model assumes that the population grows at a constant rate, without any limitations. The logistic growth model, on the other hand, takes into account the carrying capacity of the environment, which is the maximum number of individuals that the environment can support.

**Population Regulation**

Population size is regulated by a variety of factors, including density-dependent factors (such as competition for resources) and density-independent factors (such as natural disasters).
