

Transcription Practice Questions

RNA is essential for bringing the genetic information stored in the DNA to where it can be used in the cell. Transcription is the process by which RNA molecules are synthesized from DNA strands. This is the first step in the transport of the genetic information contained in DNA. The process of transcription is very similar to that of DNA replication.

Notes: The anti-template strand of DNA serves as the new RNA strand except that it replaces T with U's.

1. List the 3 types of RNA that are involved in protein synthesis and what they do.

Messenger RNA (mRNA): Carries instructions from a gene to make a protein. Carries "message" from DNA in nucleus → ribosomes in cytosol

Ribosomal RNA (rRNA): Part of the ribosome. Ribosomes are organelles that make proteins.

Transfer RNA (tRNA): Transfers amino acids to the ribosome to make a protein.

2. What is produced during transcription? mRNA, tRNA, rRNA (messenger)
3. Where does transcription take place? nucleus
