range and by extending their operation to infrared wavelengths Near infrared NIR SiGe photodetectors have been demonstrated to have a zero change CMOS process flow while the investigation of new effects and structures has shown that an all Si approach could be a viable option to construct devices comparable with Ge technology In addition the capability to integrate new emerging 2D and 3D materials with Si together with the capability of manufacturing devices at the nanometric scale has led to the development of new device families with unexpected performance Accordingly this Special Issue of Micromachines seeks to showcase research papers short communications and review articles that show the most recent advances in the field of silicon photodetectors and their respective applications **Research and Development Progress**
