Fluorescence Lifetime Spectroscopy and Imaging Principles and Applications in Biomedical Diagnostics **Imaging from Cells to Animals In Vivo** Margarida Barroso, Xavier Intes, 2020-12-03 Imaging from Cells to Animals In Vivo offers an overview of optical imaging techniques developed over the past two decades to investigate biological processes in live cells and tissues. It comprehensively covers the main imaging approaches used as well as the application of those techniques to biological investigations in preclinical models. Among the areas covered are cell metabolism, receptor-ligand interactions, membrane trafficking, cell signaling, cell migration, cell adhesion, cytoskeleton, and other processes using various molecular optical imaging techniques in living organisms such as mice and zebrafish. Features: Brings together biology and advanced optical imaging techniques to provide an overview of progress and modern methods from microscopy to whole-body imaging. Fills the need for a comprehensive view of application-driven development and use of new tools to ask new biological questions in the context of a living system. Includes basic chapters on key methods and instrumentation from fluorescence microscopy and imaging to endoscopy, optical coherence tomography, and super-resolution imaging. Discusses approaches at different length scales and biomedical applications to the study of single cell, whole organ, and whole organism behavior. Addresses the impact on discovery such as cellular function as implicated in human disease and translational medicine, for example in cancer diagnosis.

High-Resolution XAS/XES Jacinto Sa, 2014-07-14 Photon in, photon out: core level spectroscopy is an emerging approach to characterize the electronic structure of catalysts and enzymes, and it is either installed or planned for intense synchrotron beam lines and X-ray free electron lasers. This type of spectroscopy requires high energy resolution spectroscopy not only for the incoming X-ray beam but also in most applications for the detection of the outgoing photons. Thus, the use of high resolution X-ray crystal spectrometers whose resolving power E/E is typically about 10^{-4} is mandatory. High Resolution XAS/XES: Analyzing Electronic Structures of Catalysts covers the latest developments in X-ray light sources, detectors, crystal spectrometers, and photon in, photon out core level spectroscopy techniques. It also addresses photon in, photon out core level spectroscopy applications for the study of catalytic systems, highlighting hard X-ray measurements primarily due to probe high penetration enabling in situ studies. This first of its kind book discusses high resolution X-ray emission spectroscopy (XES) and X-ray absorption spectroscopy (XAS) in terms of time-resolved and surface enhancement. Supplies an understanding of catalytic reactivity essential for capitalizing on core level X-ray spectroscopy at fourth generation light sources (XFELs). Describes all spectrometers developed to perform core level X-ray spectroscopy considering the advantages and disadvantages of each. Details methods to elucidate aspects of catalysts under working conditions such as active sites and molecule adsorption. Introduces theoretical calculations of spectra and explores biological as well as heterogeneous catalysts. Complete with guidelines and warnings for the use of this type of spectroscopy. High Resolution XAS/XES: Analyzing Electronic Structures of Catalysts provides a comprehensive overview of the current state of this exciting field.
