Chemistry - Changes of State, Vapor Pressure, & Phase Diagrams

Generic Phase Diagram

- Sublimation is the phase change as a substance changes from a solid to a gas without passing through the intermediate state of a liquid.
- Deposition is the phase change as a substance changes from a gas to a solid without passing through the intermediate state of a liquid.
- **TRIPLE POINT** - The temperature and pressure at which the solid, liquid, and gas phases exist simultaneously.
- **CRITICAL POINT** - The temperature above which a substance will always be a gas regardless of the pressure.
- **NOTE:**
 - The solid phase is more dense than the liquid phase.
 - The line between the solid and gas phases is the equilibrium of solid and gas phases at that specific pressure and temperature, i.e. a curve of all the deposition/sublimation points.
 - The line between the solid and liquid phases is the equilibrium of solid and liquid phases at that specific pressure and temperature, i.e. a curve of all the freezing/melting points.
 - The line between the liquid and gas phases is the equilibrium of liquid and gas phases at that specific pressure and temperature, i.e. a curve of all the vaporization/condensation points.
- **Melting Point (Freezing Point)** - The temperature at which the solid and liquid phases of a substance are in equilibrium at atmospheric pressure.
 - **Normal Melting Point (Freezing Point)** - The temperature at which the solid changes to a liquid at Standard Pressure (1.00 atm = 760 mmHg = 760 torr = 101.325 kPa)
- **Boiling Point (Condensation Point)** - The temperature at which the vapor pressure of a liquid is equal to the pressure on the liquid.
 - **Normal Boiling Point (Condensation Point)** - The temperature at which the vapor pressure of a liquid is equal to Standard Pressure (1.00 atm = 760 mmHg = 760 torr = 101.325 kPa)

Phase Diagram for Water

Solar Thermal Energy Storage H.P. Garg, S.C. Mullick, Vijay K. Bhargava, 2012-12-06

Energy Storage not only plays an important role in conserving the energy but also improves the performance and reliability of a wide range of energy systems. Energy storage leads to saving of premium fuels and makes the system more cost effective by reducing the wastage of energy. In most systems there is a mismatch between the energy supply and energy demand. The energy storage can even out this imbalance and thereby help in savings of capital costs. Energy storage is all the more important where the energy source is intermittent such as Solar Energy. The use of intermittent energy sources is likely to grow. If more and more solar energy is to be used for domestic and industrial applications then energy storage is very crucial. If no storage is used in solar energy systems then the major part of the energy demand will be met by the back up or auxiliary energy and therefore the so called annual solar load fraction will be very low. In case of solar energy both short term and long term energy storage systems can be used which can adjust the phase difference between solar energy supply and energy demand and can match seasonal demands to the solar availability respectively. Thermal energy storage can lead to capital cost savings, fuel savings and fuel substitution in many application areas. Developing an optimum thermal storage system is as important an area of research as developing an alternative source of energy.
