

Keystone Species

Saguaro Cactus

What is a keystone species?

A keystone species is a species that has a disproportionately large effect on its environment relative to its abundance. The concept was developed by ecologist Robert Paine in 1969, based on his studies of intertidal rocky shore communities.

Keystone species are often predators, but they can also be engineers, mutualists, or other types of organisms. The removal of a keystone species from an ecosystem can have cascading effects on the entire community, leading to a loss of biodiversity and a change in the structure and function of the ecosystem.

Why is the saguaro a keystone species?

The saguaro cactus is a keystone species in the Sonoran Desert because of its unique shape and size, which provide a variety of habitats for many different animals. The cactus is also a source of food for many animals, including birds, lizards, and snakes.

How does the saguaro cactus provide habitat?

The saguaro cactus provides habitat for many different animals, including birds, lizards, and snakes. The cactus is also a source of food for many animals, including birds, lizards, and snakes.

How does the saguaro cactus provide food?

The saguaro cactus provides food for many different animals, including birds, lizards, and snakes. The cactus is also a source of food for many animals, including birds, lizards, and snakes.
