

Bale Slice Actuator Position Sensor

The Bale Slice actuator sensor, 1, is a rotary potentiometer that changes the level of its return signal to the controller based on the amount of rotation of the sensor rotor (center section) that is connected through linkage to the knife operating arm, 2. The controller converts the signal to determine the position of the actuator.

Figure 1-13

HOW THE BALE COMMAND PLUS SYSTEM OPERATES

NOTE: The Bale Command system is designed for use with a 12-volt negative ground system only.

The following describes the automatic operation of the Bale Command Plus system during the formation and wrapping of a 60" bale with the Bale Slice system turned ON. Balers without the Bale Slice option operate the same except for the references to the Bale Slice system.

Figure 1-14

BALE FORMATION - TWINE OR NET

As the bale size increases (after the core is formed), the linkage from the take-up arm, 1, moves the bale size sensor arm, 2, and changes the output signal to the controller.

The controller converts the signal to bale size and changes the display on the operator's panel. The left and right bale shape sensors also send signals to the controller which uses the signals to change the height of the respective bar graphs to provide a guide for the operator to produce a uniform bale.
