data has promoted a deeper understanding of the means by which these phages attach to and infect their hosts and permitted the development of effective anti phage strategies Furthermore the presence and activity of host encoded phage resistance systems that operate at various stages of the phage cycle and the potential for the application of such systems consolidates the value of research in this area Conversely phages and their components have been applied as therapeutic agents against a number of pathogens including among others *Clostridium difficile* *Lactococcus garviae* *Mycobacterium* spp *Listeria* spp and the possibilities and limitations of these systems will be explored in this topic Additionally phage therapeutic approaches have been applied to the prevention of development of food spoilage organisms in the brewing and beverage sectors and exhort the positive applications of phages in the industrial setting This research topic is aimed to address the most current issues as well as the most recent advances in the research of phages infecting Gram positive bacteria covering areas such as phages in food fermentations their impact in industry phage ecology genomics evolution structural analysis phage host interactions and the application of phages and components thereof as therapeutic agents against human and animal pathogens

Functional Imaging in living Plants - Cell Biology meets Physiology Alex Costa, Markus Schwarzländer, George R Littlejohn, Tobias Meckel, 2015-05-08 The study of plant cell physiology is currently experiencing a profound transformation Novel techniques allow dynamic in vivo imaging with subcellular resolution covering a rapidly growing range of plant cell physiology Several basic biological questions that have been inaccessible by the traditional combination of biochemical physiological and cell biological approaches now see major progress Instead of grinding up tissues destroying their organisation or describing cell and tissue structure without a measure for its function novel imaging approaches can provide the critical link between localisation function and dynamics Thanks to a fast growing collection of available fluorescent protein variants and sensors along with innovative new microscopy technologies and quantitative analysis tools a wide range of plant biology can now be studied in vivo including cell morphology migration protein localization topology movement protein protein interaction organelle dynamics as well as ion ROS redox dynamics Within the cell genetic targeting of fluorescent protein probes to different organelles and subcellular locations has started to reveal the stringently compartmentalized nature of cell physiology and its sophisticated spatiotemporal regulation in response to environmental stimuli Most importantly such cellular processes can be monitored in their natural 3D context even in complex tissues and organs a condition not easily met in studies on mammalian cells Recent new insights into plant cell physiology by functional imaging have been largely driven by technological developments such as the design of novel sensors innovative microscopy imaging techniques and the quantitative analysis of complex image data Rapid further advances are expected which will require close interdisciplinary interaction of plant biologists with chemists physicists mathematicians and computer scientists High throughput approaches will become increasingly important to fill genomic data with life on the scale of cell physiology If the vast body of information generated in the omics era is to generate actual mechanistic understanding of how the live plant cell works functional imaging has enormous potential to adopt the role of a versatile standard tool across plant biology and crop breeding We welcome original research papers methodological papers reviews and mini reviews with particular attention to contributions in which novel imaging techniques enhance our understanding of plant cell physiology and permits to answer questions that cannot be easily addressed with other techniques DRENAJE ÁCIDO DE MINA EN LA FAJA

PIRÍTICA IBÉRICA GRANDE GIL, JOSÉ ANTONIO, 2016-05-26 A lo largo de la Faja Pirítica Ibérica existen cerca de 200 antiguas explotaciones muchas de ellas de sulfuros y más de 5 000 ha de escombreras sin medidas preventivas ni correctoras orientadas a la preservación del medio hídrico. Estas explotaciones conforman un entramado de efluentes difusos que a merced de las precipitaciones continúan emitiendo lixiviados cidos después del abandono de la actividad extractiva y que son responsables de la degradación de los sistemas hídricos afectados desde los cauces receptores en medio generador hasta los embalses y Ría de Huelva como integrantes del medio receptor de los flujos cidos contaminantes. El interés de esta obra se concreta en la puesta en escena de las últimas técnicas y herramientas disponibles para la monitorización y modelización del proceso de drenaje cido de minas como de los restos presentes de antiguas explotaciones mineras de sulfuros a lo largo de la Faja Pirítica que pudiera servir de punto de encuentro a investigadores promotores responsables de la gestión del territorio legisladores y estudiosos de la actividad minera en este nuevo escenario condicionado por el creciente precio del cobre.
