Prior Knowledge Questions (Do these BEFORE using the Gizmo.)

[Note: The purpose of these questions is to activate prior knowledge and get students thinking. Students are not expected to know the answers to the Prior Knowledge Questions.]

1. A big bully is having a tug-of-war with a small child. There is a ball attached to the middle of the rope.

Toward whom will the ball move? **The big bully.**

2. Two equally strong kids are having a tug-of-war. What do you expect to happen to the ball in this situation? **The ball will stay in the middle, halfway between them.**

Gizmo Warm-up

Just like in a tug-of-war, atoms that are bonded to one another pull on the electrons they share. In the Polarity and Intermolecular Forces Gizmo, you will explore how these opposing forces relate to bond types and the forces between molecules.

To begin, drag the Na (sodium) and Cl (chlorine) atoms into the simulation area. Turn on **Show valence electrons**. A **valence electron** is found in the outermost energy level of the atom.

1. Click **Play** (▶). What do you notice?

The Na atom shrinks and the Cl atom expands. The orange valence electron moves from the Na atom to the Cl atom.

2. Which atom seems to be pulling more on the sodium's one valence electron? **The Cl atom.**

How do you know? **The chlorine atom wins the "tug of war" for the valence electron.**

3. What happens to the colors of the simulated atoms, and what does this indicate?

The Na atom turns blue, indicating a positive charge. The Cl atom turns red, indicating a negative charge.

Corrosion and Electrochemistry of Zinc Xiaoge Gregory Zhang, 2013-06-29 Humankind's use of zinc stretches back to antiquity and it was a component in some of the earliest known alloy systems. Even though metallic zinc was not discovered in Europe until 1746 by Marggrat, zinc ores were used for making brass in biblical times and an 87% zinc alloy was found in prehistoric ruins in Transylvania. Also, zinc the metal was produced in quantity in India as far back as the thirteenth century well before it was recognized as being a separate element. The uses of zinc are manifold ranging from galvanizing to die castings to electronics. It is a preferred anode material in high energy density batteries e.g. Ni-Zn, Ag-Zn, Zn-Zn. So that its electrochemistry particularly in alkaline media has been extensively explored. In the passive state zinc is photoelectrochemically active with the passive film displaying n-type characteristics. For the same reason that zinc is considered to be an excellent battery anode it has found extensive use as a sacrificial anode for the protection of ships and pipelines from corrosion. Indeed, aside from zinc's well known attributes as an alloying element its widespread use is principally due to its electrochemical properties which include a well placed position in the galvanic series for protecting iron and steel in natural aqueous environments and its reversible dissolution behavior in alkaline solutions. *Algebra Problems with Worked Solutions* Quantum Scientific Publishing, Each book in our series of worked problems contains hundreds of problems with answers and detailed solutions.
